Definitions of Managed Objects for
Asymmetric Digital Subscriber Line 2 (ADSL2)

Status of This Memo

This document specifies an Internet standards track protocol for the Internet community, and requests discussion and suggestions for improvements. Please refer to the current edition of the "Internet Official Protocol Standards" (STD 1) for the standardization state and status of this protocol. Distribution of this memo is unlimited.

Abstract

This document defines a Management Information Base (MIB) module for use with network management protocols in the Internet community. In particular, it describes objects used for managing parameters of the "Asymmetric Digital Subscriber Line" family of interface types: ADSL, ADSL2, ADSL2+, and their variants.

1. The Internet-Standard Management Framework

For a detailed overview of the documents that describe the current Internet-Standard Management Framework, please refer to Section 7 of RFC 3410 [RFC3410].

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. MIB objects are generally accessed through the Simple Network Management Protocol (SNMP). Objects in the MIB are defined using the mechanisms defined in the Structure of Management Information (SMI). This memo specifies a MIB module that is compliant to the SMIV2, which is described in STD 58, RFC 2578 [RFC2578], STD 58, RFC 2579 [RFC2579] and STD 58, RFC 2580 [RFC2580].

2. Overview

This document defines a Management Information Base (MIB) module for use with network management protocols in the Internet community for the purpose of managing ADSL, ADSL2, and ADSL2+ lines.

The MIB module described in RFC 2662 [RFC2662] describes objects used for managing Asymmetric Bit-Rate DSL (ADSL) interfaces per [T1E1.413], [G.992.1], and [G.992.2]. These object descriptions are based upon the specifications for the ADSL Embedded Operations Channel (EOC) as defined in American National Standards Institute (ANSI) T1E1.413/1995 [T1E1.413] and International Telecommunication Union (ITU-T) G.992.1 [G.992.1] and G.992.2 [G.992.2].

This document does not obsolete RFC 2662 [RFC2662], but rather provides a more comprehensive management model that includes the ADSL2 and ADSL2+ technologies per G.992.3, G.992.4, and G.992.5 ([G.992.3], [G.992.4], and [G.992.5] respectively). In addition, objects have been added to improve the management of ADSL, ADSL2, and ADSL2+ lines.

Additionally, the management framework for New Generation ADSL lines specified [TR-90] by the Digital Subscriber Line Forum (DSL Forum) has been taken into consideration. That framework is based on ITU-T G.997.1 standard [G.997.1] as well as on two amendments: ([G.997.1am1] and [G.997.1am2]). This document refers to all three documents as G.997.1. That is, a MIB attribute whose REFERENCE section provides a paragraph number in ITU-T G.997.1 is actually originated from either G.997.1 [G.997.1] or one of its amendment documents.

Note that the revised ITU-T G.997.1 standard also refers to the next generation of VDSL technology, known as VDSL2, as per ITU-T G.993.2 [G.993.2]. However, managing VDSL2 lines is currently beyond the scope of this document.

The MIB module is located in the MIB tree under MIB 2 transmission, as discussed in the IANA Considerations section of this document.

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in RFC 2119 [RFC2119].

2.1. Relationship to Other MIBs

This section outlines the relationship of this MIB module with other MIB modules described in RFCs. Specifically, IF-MIB as presented in RFC 2863 [RFC2863] is discussed.

2.1.1. General IF-MIB Integration (RFC 2863)

The ADSL2 Line MIB specifies the detailed attributes of a data interface. As such, it needs to integrate with RFC 2863 [RFC2863]. The IANA has assigned the following ifTypes, which may be applicable for ADSL lines:

IANAifType ::= TEXTUAL-CONVENTION

```
...
SYNTAX INTEGER {
    ...
    channel(70),      -- Channel
    adsl(94),         -- Asymmetric Digital Subscriber Loop
    ...
    interleave(124), -- Interleaved Channel
    fast(125),        -- Fast Channel
    ...
    adsl2plus(238),   -- Asymmetric Digital Subscriber Loop Version 2,
                      -- Version 2 Plus, and all variants
    ...
}
```

ADSL lines that are identified with ifType=adsl(94) MUST be managed with the MIB specified by RFC 2662. ADSL, ADSL2, and ADSL2+ lines identified with ifType=adsl2plus(238) MUST be managed with the MIB specified by this document.

In any case, the SNMP agent may use either `ifType=interleave(124)` or `fast(125)` for each channel, e.g., depending on whether or not it is capable of using an interleaver on that channel. It may use the `ifType=channel(70)` when all channels are capable of using an interleaver (e.g., for ADSL2 XTUs).

Note that the `ifFixedLengthGroup` from RFC 2863 [RFC2863] MUST be supported and that the `ifRcvAddressGroup` does not apply to this MIB module.

2.1.2. Usage of `ifTable`

The MIB branch identified by `ifType` contains tables appropriate for the interface types described above. Most such tables extend the `ifEntry` table and are indexed by `ifIndex`. For interfaces in systems implementing this MIB module, those table entries indexed by `ifIndex` MUST be persistent.

The following attributes are part of the mandatory `ifGeneralInformationGroup` in the Interfaces MIB [RFC2863] and are not duplicated in the ADSL2 Line MIB.

=====

<code>ifIndex</code>	Interface index.
<code>ifDescr</code>	See interfaces MIB.
<code>ifType</code>	<code>adsl2plus(238)</code> or <code>channel(70)</code> or <code>interleave(124)</code> or <code>fast(125)</code> .
<code>ifSpeed</code>	Set as appropriate.
<code>ifPhysAddress</code>	This object MUST have an octet string with zero length.
<code>ifAdminStatus</code>	See interfaces MIB.
<code>ifOperStatus</code>	See interfaces MIB.
<code>ifLastChange</code>	See interfaces MIB.
<code>ifName</code>	See interfaces MIB.
<code>ifAlias</code>	See interfaces MIB.

ifLinkUpDownTrapEnable Default to enabled(1).

ifHighSpeed Set as appropriate.

ifConnectorPresent Set as appropriate.

=====

Figure 1: Use of ifTable Objects

2.2. IANA Considerations

The IANA has allocated ifType=adsl2plus(238) for Asymmetric Digital Subscriber Loop Version 2. A separate ifType number was necessary to distinguish between ADSL lines that are managed with the RFC 2662 management model and ADSL/ADSL2 and ADSL2+ lines managed with the model defined in this document.

Also, the IANA has assigned transmission number 238 to the ADSL2-LINE-MIB module.

An assignment was in fact done when RFC 2662 was published, but as this MIB does not obsolete RFC 2662, it required a new assignment from IANA.

2.3. Conventions Used in the MIB Module

2.3.1. Naming Conventions

ATU	ADSL Transceiver Unit
ATU-C	ATU at the Central office end (i.e., network operator).
ATU-R	ATU at the Remote end (i.e., subscriber end of the loop).
XTU	A terminal unit; either an ATU-C or an ATU-R.
CRC	Cyclic Redundancy Check
DELT	Dual Ended Loop Test
ES	Errored Second
FEC	Forward Error Correction
LOF	Loss Of Frame
LOS	Loss Of Signal
LOSS	LOS Seconds
SES	Severely-Errored Second
SNR	Signal-to-Noise Ratio
UAS	Unavailable Seconds

2.3.2. Textual Conventions

The following textual conventions are defined to reflect the line topology in the MIB module (further discussed in the following section), the various transmission modes, power states, synchronization states, possible values for various configuration parameters, status parameters, and other parameter types.

o Adsl2Unit:

Attributes with this syntax uniquely identify each unit in the ADSL/ADSL2/ADSL2+ link. It mirrors the EOC addressing mechanism:

atuc(1)	- Central office ADSL transceiver unit (ATU-C).
atur(2)	- Remote ADSL transceiver unit (ATU-R).

o Adsl2Direction:

Attributes with this syntax uniquely identify a transmission direction in an ADSL/ADSL2/ADSL2+ link. Upstream direction is a transmission from the remote end (ATU-R) towards the central office end (ATU-C), while downstream direction is a transmission from the ATU-C towards the ATU-R.

upstream(1)	- Transmission from the ATU-R to the ATU-C.
downstream(2)	- Transmission from the ATU-C to the ATU-R.

o Adsl2TransmissionModeType:

Attributes with this syntax reference the list of possible transmission modes for ADSL/ADSL2 or ADSL2+.

Specified as a BITS construct, there are currently a few dozen transmission modes in the list.

o Adsl2RaMode:

Attributes with this syntax reference if and how Rate-Adaptive synchronization is being used on the respective ADSL/ADSL2 or ADSL2+ link:

manual(1)	- No Rate-Adaptation. The initialization process attempts to synchronize to a specified rate.
raInit(2)	- Rate-Adaptation during initialization process only, which attempts to synchronize to a rate between minimum and maximum specified values.

dynamicRa(3) - Dynamic Rate-Adaptation during initialization process as well as during SHOWTIME.

o Adsl2InitResult:

Attributes with this syntax reference the recent result of a full initialization attempt:

noFail(0)	- Successful initialization.
configError(1)	- Configuration failure.
configNotFeasible(2)	- Configuration details not supported.
commFail(3)	- Communication failure.
noPeerAtu(4)	- Peer ADSL Transceiver Unit (ATU) not detected.
otherCause(5)	- Other initialization failure reason.

o Adsl2OperationModes:

Attributes with this syntax uniquely identify an ADSL mode, which is a category associated with each transmission mode defined for the ADSL/ADSL2 or ADSL2+ link. Part of the line configuration profile depends on the ADSL Mode:

Specified as an enumeration construct, there are currently a few dozen transmission modes in the list.

o Adsl2PowerMngState:

Attributes with this syntax uniquely identify each power management state defined for the ADSL/ADSL2 or ADSL2+ link:

l0(1)	- L0 - Full power management state.
l1(2)	- L1 - Low power management state (for G.992.2).
l2(3)	- L2 - Low power management state (for G.992.3, G.992.4, and G.992.5).
l3(4)	- L3 - Idle power management state.

o Adsl2ConfPmsForce:

Attributes with this syntax are configuration parameters that reference the desired power management state for the ADSL/ADSL2 or ADSL2+ link:

l3toL0(0)	- Perform a transition from L3 to L0 (Full power management state).
l0toL2(2)	- Perform a transition from L0 to L2 (Low power management state).

l0orL2toL3(3) - Perform a transition into L3 (Idle power management state).

o Adsl2LConfProfPmMode:

Attributes with this syntax are configuration parameters that reference the power modes/states into which the ATU-C or ATU-R may autonomously transit.

This is a BITS structure that allows control of the following transit options:

allowTransitionsToIdle(0) - XTU may autonomously transit to idle (L3) state.
allowTransitionsToLowPower(1) - XTU may autonomously transit to low-power (L2) state.

o Adsl2LineLdsf:

Attributes with this syntax are configuration parameters that control the Loop Diagnostic mode for the ADSL/ADSL2 or ADSL2+ link:

inhibit(0) - Inhibit Loop Diagnostic mode.
force(1) - Force/Initiate Loop Diagnostic mode.

o Adsl2LdsfResult:

Attributes with this syntax are status parameters that report the result of the recent Loop Diagnostic mode issued for the ADSL/ADSL2 or ADSL2+ link:

none(1) - The default value, in case loop diagnostics mode forced (LDSF) was never requested for the associated line.
success(2) - The recent command completed successfully.
inProgress(3) - The Loop Diagnostics process is in progress.
unsupported(4) - The NE or the line card doesn't support LDSF.
cannotRun(5) - The NE cannot initiate the command, due to a nonspecific reason.
aborted(6) - The Loop Diagnostics process aborted.
failed(7) - The Loop Diagnostics process failed.
illegalMode(8) - The NE cannot initiate the command, due to the specific mode of the relevant line.

- adminUp(9) - The NE cannot initiate the command because the relevant line is administratively 'Up'.
- tableFull(10) - The NE cannot initiate the command, due to reaching the maximum number of rows in the results table.
- noResources(11) - The NE cannot initiate the command, due to lack of internal memory resources.

o Adsl2SymbolProtection:

Attributes with this syntax are configuration parameters that reference the minimum-length impulse noise protection (INP) in terms of number of symbols:

- noProtection(1) - INP not required.
- halfSymbol(2) - INP length = 1/2 symbol.
- singleSymbol(3) - INP length = 1 symbol.
- twoSymbols(4) - INP length = 2 symbols.
- threeSymbols(5) - INP length = 3 symbols.
- fourSymbols(6) - INP length = 4 symbols.
- fiveSymbols(7) - INP length = 5 symbols.
- sixSymbols(8) - INP length = 6 symbols.
- sevenSymbols(9) - INP length = 7 symbols.
- eightSymbols(10) - INP length = 8 symbols.
- nineSymbols(11) - INP length = 9 symbols.
- tenSymbols(12) - INP length = 10 symbols.
- elevenSymbols(13) - INP length = 11 symbols.
- twelveSymbols(14) - INP length = 12 symbols.
- thirteenSymbols(15) - INP length = 13 symbols.
- fourteenSymbols(16) - INP length = 14 symbols.
- fifteenSymbols(17) - INP length = 15 symbols.
- sixteenSymbols(18) - INP length = 16 symbols.

o Adsl2MaxBer:

Attributes with this syntax are configuration parameters that reference the maximum Bit Error Rate (BER):

- eminus3(1) - Maximum BER= E^{-3} .
- eminus5(2) - Maximum BER= E^{-5} .
- eminus7(3) - Maximum BER= E^{-7} .

o Adsl2ScMaskDs:

Attributes with this syntax are configuration parameters that reference the downstream sub-carrier mask. It is a bitmap of up to 512 bits.

- o Adsl2ScMaskUs:

Attributes with this syntax are configuration parameters that reference the upstream sub-carrier mask. It is a bitmap of up to 64 bits.

- o Adsl2RfiDs:

Attributes with this syntax are configuration parameters that reference the downstream notch filters. It is a bitmap of up to 512 bits.

- o Adsl2PsdMaskDs:

Attributes with this syntax are configuration parameters that reference the downstream power spectrum density (PSD) mask. It is a structure of up to 32 breakpoints, where each breakpoint occupies 3 octets.

- o Adsl2PsdMaskUs:

Attributes with this syntax are configuration parameters that reference the upstream power spectrum density (PSD) mask. It is a structure of up to 4 breakpoints, where each breakpoint occupies 3 octets.

- o Adsl2Tssi:

Attributes with this syntax are status parameters that reference the transmit spectrum shaping (TSSi). It is a structure of up to 32 breakpoints, where each breakpoint occupies 3 octets.

- o Adsl2LastTransmittedState:

Attributes with this syntax reference the list of initialization states for ADSL/ADSL2 or ADSL2+ modems. The list of states for CO side modems (ATU-Cs) is different from the list of states for the remote side modems (ATU-Rs).

Specified as an enumeration type, there are currently a few dozen states in the list per each unit side (i.e., ATU-C or ATU-R).

- o Adsl2LineStatus:

Attributes with this syntax are status parameters that reflect the failure status for a given endpoint of ADSL/ADSL2 or ADSL2+ link.

This is a BITS structure that can report the following failures:

- noDefect(0) - This bit position positively reports that no defect or failure exists.
- lossOfFrame(1) - Loss of frame synchronization.
- lossOfSignal(2) - Loss of signal.
- lossOfPower(3) - Loss of power. Usually this failure may be reported for ATU-Rs only.
- initFailure(4) - Recent initialization process failed. Never active on ATU-R.

o Adsl2ChAtmStatus:

Attributes with this syntax are status parameters that reflect the failure status for Transmission Convergence (TC) layer of a given ATM interface (data path over an ADSL/ADSL2 or ADSL2+ link).

This is a BITS structure that can report the following failures:

- noDefect(0) - This bit position positively reports that no defect or failure exists.
- noCellDelineation(1) - The link was successfully initialized but cell delineation was never acquired on the associated ATM data path.
- lossOfCellDelineation(2) - Loss of cell delineation on the associated ATM data path.

o Adsl2ChPtmStatus:

Attributes with this syntax are status parameters that reflect the failure status for a given PTM interface (packet data path over an ADSL/ADSL2 or ADSL2+ link).

This is a BITS structure that can report the following failures:

- noDefect(0) - This bit position positively reports that no defect or failure exists.
- outOfSync(1) - Out of synchronization.

2.4. Structure

The MIB module is structured into following MIB groups:

o Line Configuration, Maintenance, and Status Group:

This group supports MIB objects for configuring parameters for the ADSL/ADSL2 or ADSL2+ line and retrieving line status information.

It also supports MIB objects for configuring a requested power state or initiating a Dual Ended Loop Test (DELT) process in the ADSL/ADSL2 or ADSL2+ line. It contains the following table:

- adsl2LineTable

- o Channel Status Group:

This group supports MIB objects for retrieving channel layer status information. It contains the following table:

- adsl2ChannelStatusTable

- o Subcarrier Status Group:

This group supports MIB objects for retrieving the sub-carrier layer status information, mostly collected by a Dual Ended Loop Test (DELT) process. It contains the following table:

- adsl2SCStatusTable

- o Unit Inventory Group:

This group supports MIB objects for retrieving Unit inventory information about units in ADSL/ADSL2 or ADSL2+ lines via the EOC. It contains the following table:

- adsl2LineInventoryTable

- o Current Performance Group:

This group supports MIB objects that provide the current performance information relating to ADSL/ADSL2 and ADSL2+ line, units and channels level. It contains the following tables:

- adsl2PMLineCurrTable
- adsl2PMLineCurrInitTable
- adsl2PMChCurrTable

- o 15-Minute Interval Performance Group:

This group supports MIB objects that provide historic performance information relating to ADSL/ADSL2 and ADSL2+ line, units and channels level in 15-minute intervals. It contains the following tables:

- adsl2PMLineHist15MinTable
- adsl2PMLineInitHist15MinTable
- adsl2PMChHist15MinTable

o 1-Day Interval Performance Group:

This group supports MIB objects that provide historic performance information relating to ADSL/ADSL2 and ADSL2+ line, units and channels level in 1-day intervals. It contains the following tables:

- adsl2PMLineHist1DayTable
- adsl2PMLineInitHist1DayTable
- adsl2PMChHist1DTable

o Configuration Template and Profile Group:

This group supports MIB objects for defining configuration profiles for ADSL/ADSL2 and ADSL2+ lines and channels, as well as configuration templates. Each configuration template is comprised of one line configuration profile and one or more channel configuration profiles. This group contains the following tables:

- adsl2LineConfTemplateTable
- adsl2LineConfProfTable
- adsl2LineConfProfModeSpecTable
- adsl2ChConfProfileTable

o Alarm Configuration Template and Profile Group:

This group supports MIB objects for defining alarm profiles for ADSL/ADSL2 and ADSL2+ lines and channels, as well as alarm templates. Each alarm template is comprised of one line alarm profile and one or more channel alarm profiles. This group contains the following tables:

- adsl2LineAlarmConfTemplateTable
- adsl2LineAlarmConfProfileTable
- adsl2ChAlarmConfProfileTable

o Notifications Group:

This group defines the notifications supported for ADSL/ADSL2 and ADSL2+ lines:

- adsl2LinePerfFECSThreshAtuc
- adsl2LinePerfFECSThreshAtur
- adsl2LinePerfESThreshAtuc

- adsl2LinePerfESThreshAtur
- adsl2LinePerfSESThreshAtuc
- adsl2LinePerfSESThreshAtur
- adsl2LinePerfLOSSThreshAtuc
- adsl2LinePerfLOSSThreshAtur
- adsl2LinePerfUASThreshAtuc
- adsl2LinePerfUASThreshAtur
- adsl2LinePerfCodingViolationsThreshAtuc
- adsl2LinePerfCodingViolationsThreshAtur
- adsl2LinePerfCorrectedThreshAtuc
- adsl2LinePerfCorrectedThreshAtur
- adsl2LinePerfFailedFullInitThresh
- adsl2LinePerfFailedShortInitThresh
- adsl2LineStatusChangeAtuc
- adsl2LineStatusChangeAtur

2.5. Persistence

All read-create objects and most read-write objects defined in this MIB module SHOULD be stored persistently. Following is an exhaustive list of these persistent objects:

```

```

Note also that the interface indices in this MIB are maintained persistently. View-based Access Control Model (VACM) data relating to these SHOULD be stored persistently as well [RFC3410].

2.6. Line Topology

An ADSL/ADSL2 and ADSL2+ Line consists of two units: ATU-C (the central office termination unit) and ATU-R (the remote termination unit). There are up to 4 channels, each carrying an independent information flow, as shown in the figure below.

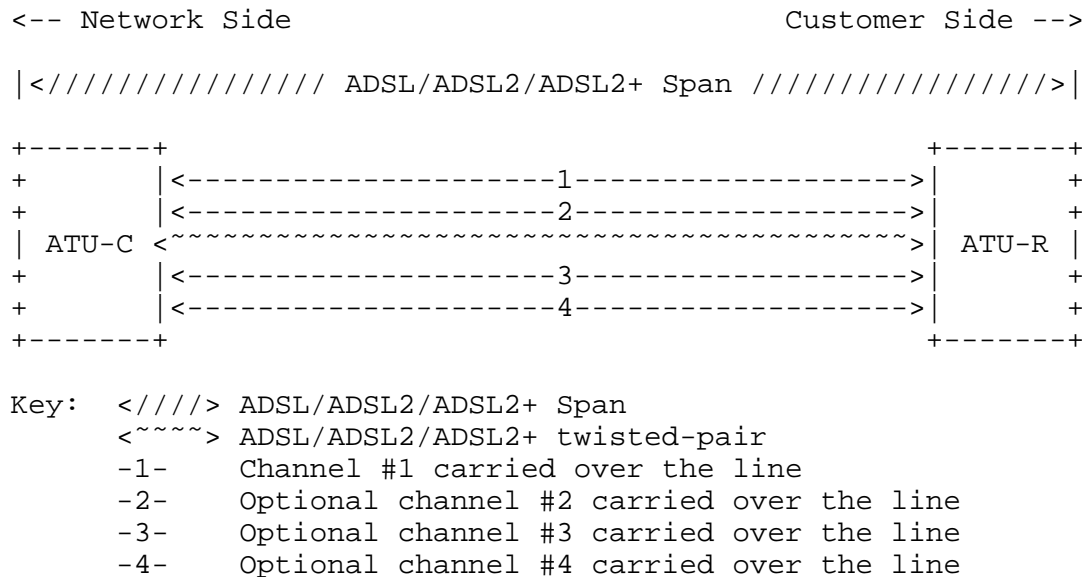

Figure 2: General topology for an ADSL/ADSL2/ADSL2+ Line

2.7. Counters, Interval Buckets, and Thresholds

2.7.1. Counters Managed

There are various types of counters specified in this MIB. Each counter refers either to the whole ADSL/ADSL2/ADSL2+ line, to one of the XTU entities, or to one of the bearer channels.

o On the whole line level

For full initializations, failed full initializations, short initializations, and failed short initializations, there are event counters, current 15-minute and 0 to 96 15-minute history bucket(s) of "interval-counters", as well as current and 0 to 30 previous 1-day interval-counter(s). Each current 15-minute "failed" event bucket has an associated threshold notification.

o On the XTU level

For the LOS Seconds, ES, SES, FEC seconds, and UAS, there are event counters, current 15-minute and 0 to 96 15-minute history bucket(s) of "interval-counters", as well as current and 0 to 30 previous 1-day interval-counter(s). Each current 15-minute event bucket has an associated threshold notification.

- o On the bearer channel level

For the coding violations (CRC anomalies) and corrected blocks (i.e., FEC events), there are event counters, current 15-minute and 0 to 96 15-minute history bucket(s) of "interval-counters", as well as current and 0 to 30 previous 1-day interval-counter(s). Each current 15-minute event bucket has an associated threshold notification.

2.7.2. Minimum Number of Buckets

Although it is possible to support up to 96 15-minute history buckets of "interval-counters", systems implementing this MIB module SHOULD practically support at least 16 buckets, as specified in ITU-T G.997.1, paragraph 7.2.7.2.

Similarly, it is possible to support up to 30 previous 1-day "interval-counters", but systems implementing this MIB module SHOULD support at least 1 previous-day bucket.

2.7.3. Interval Buckets Initialization

There is no requirement for an agent to ensure a fixed relationship between the start of a 15-minute interval and any wall clock; however, some implementations may align the 15-minute intervals with quarter hours. Likewise, an implementation may choose to align one day intervals with the start of a day.

Counters are not reset when an XTU is reinitialized, only when the agent is reset or reinitialized (or under specific request outside the scope of this MIB module).

2.7.4. Interval Buckets Validity

As in RFC 3593 [RFC3593] and RFC 2662 [RFC2662], in case the data for an interval is suspect or known to be invalid, the agent MUST report the interval as invalid. If the current 15-minute event bucket is determined to be invalid, the element management system SHOULD ignore its content, and the agent MUST NOT generate notifications based upon the value of the event bucket.

A valid 15-minute event bucket SHOULD usually count the events for exactly 15 minutes. Similarly, a valid 1-day event bucket SHOULD usually count the events for exactly 24 hours. However, the following scenarios are exceptional:

- 1) For implementations that align the 15-minute intervals with quarter hours, and the 1-day intervals with start of a day, the management system may still start the PM process not aligned with the wall clock. Such a management system may wish to retrieve even partial information for the first event buckets, rather than declaring them all as invalid.
- 2) For an event bucket that suffered relatively short outages, the management system may wish to retrieve the available PM outcomes, rather than declare the whole event bucket as invalid. This is more important for 1-day event buckets.
- 3) An event bucket may be shorter or longer than the formal duration if a clock adjustment was performed during the interval.

This MIB allows supporting the exceptional scenarios described above by reporting the actual Monitoring Time of a monitoring interval. This parameter is relevant only for Valid intervals, but is useful for these exceptional scenarios:

- a) The management system MAY still declare a partial PM interval as Valid and report the actual number of seconds the interval lasted.
- b) If the interval was shortened or extended due to clock corrections, the management system SHOULD report the actual number of seconds the interval lasted, besides reporting that the interval is Valid.

2.8. Profiles

As a managed node can handle a large number of XTUs, (e.g., hundreds or perhaps thousands of lines), provisioning every parameter on every XTU may become burdensome. Moreover, most lines are provisioned identically with the same set of parameters. To simplify the provisioning process, this MIB module makes use of profiles and templates.

A configuration profile is a set of parameters that can be shared by multiple entities. There are configuration profiles to address the line-level provisioning, and another type of profile that addresses the channel-level provisioning parameters.

A configuration template is actually a profile-of-profiles. That is, a template is comprised of one line configuration profile and one or more channel configuration profiles. A template provides the complete configuration of a line. The same configuration can be shared by multiple lines.

Similarly to the configuration profiles and templates, this MIB module makes use of templates and profiles for specifying the alarm thresholds associated with performance parameters. This allows provisioning multiple lines with the same criteria for generating threshold crossing notifications.

The following paragraphs describe templates and profiles used in this MIB module

2.8.1. Configuration Profiles and Templates

- o Line Configuration Profiles - Line configuration profiles contain parameters for configuring the low layer of ADSL/ADSL2 and ADSL2+ lines. They are defined in the `adsl2LineConfProfTable`.

The line configuration includes issues such as the specific ADSL/ADSL2 or ADSL2+ modes to enable on the respective line, power spectrum parameters, rate adaptation criteria, and SNR margin-related parameters. A subset of the line configuration parameters depends upon the specific ADSL Mode allowed (i.e., Does the profile allow ADSL, ADSL2, and/or ADSL2+) as well as what annex/annexes of the standard are allowed. This is the reason a line profile MUST include one or more mode-specific extensions.

- o Channel Configuration Profiles - Channel configuration profiles contain parameters for configuring bearer channels over the ADSL/ADSL2 and ADSL2+ lines. They are sometimes considered the service layer configuration of the ADSL/ADSL2 and ADSL2+ lines. They are defined in the `adsl2ChConfProfTable`.

The channel configuration includes issues such as the desired minimum and maximum rate on each traffic flow direction and impulse noise protection parameters.

- o Line Configuration Templates - Line configuration templates allow combining line configuration profiles and channel configuration profiles to a comprehensive configuration of the ADSL/ADSL2 and ADSL2+ line. They are defined in the `adsl2LineConfTemplateTable`.

The line configuration template includes one index (OID) of a line configuration profile and one to four indexes of channel configuration profiles. The template also addresses the issue of distributing the excess available data rate on each traffic flow direction (i.e., the data rate left after each channel is allocated a data rate to satisfy its minimum requested data rate) among the various channels.

2.8.2. Alarm Configuration Profiles and Templates

- o Line Alarm Configuration Profiles - Line-level Alarm configuration profiles contain the threshold values for Performance Monitoring (PM) parameters, counted either on the whole line level or on an XTU level. Thresholds are required only for failures and anomalies, e.g., there are thresholds for failed initializations and LOS seconds, but not for the aggregate number of full initializations. These profiles are defined in the `adsl2LineAlarmConfProfileTable`.
- o Channel Alarm Configuration Profiles - Channel-level Alarm configuration profiles contain the threshold values for PM parameters counted on a bearer channel level. Thresholds are defined for two types of anomalies: corrected blocks and coding violations. These profiles are defined in the `adsl2ChAlarmConfProfileTable`.
- o Line Alarm Configuration Templates - Line Alarm configuration templates allow combining line-level alarm configuration profiles and channel-level alarm configuration profiles to a comprehensive configuration of the PM thresholds for ADSL/ADSL2 and ADSL2+ line. They are defined in the `adsl2LineAlarmConfTemplateTable`.

The line alarm configuration template includes one index (OID) of a line-level alarm configuration profile and one to four indexes of channel-level alarm configuration profiles.

2.8.3. Managing Profiles and Templates

The index value for each profile and template is a locally-unique, administratively assigned name having the textual convention 'SnmpAdminString' (RFC 3411 [RFC3411]).

One or more lines may be configured to share parameters of a single configuration template (e.g., `adsl2LConfTempTemplateName` = 'silver') by setting its `adsl2LineCnfgTemplate` objects to the value of this template.

One or more lines may be configured to share parameters of a single Alarm configuration template (e.g., `adsl2LAlarmConfTempTemplateName` = 'silver') by setting its `adsl2LineAlarmCnfgTemplate` objects to the value of this template.

Before a template can be deleted or taken out of service, it MUST first be unreferenced from all associated lines. Implementations MAY also reject template modification while it is associated with any line.

Before a profile can be deleted or taken out of service, it MUST first be unreferenced from all associated templates. Implementations MAY also reject profile modification while it is referenced by any template.

Implementations MUST provide a default profile whose name is 'DEFVAL' for each profile and template type. The values of the associated parameters will be vendor-specific unless otherwise indicated in this document. Before a line's templates have been set, these templates will be automatically used by setting `adsl2LineCnfgTemplate` and `adsl2LineAlarmCnfgTemplate` to 'DEFVAL' where appropriate. This default profile name, 'DEFVAL', is considered reserved in the context of profiles and templates defined in this MIB module.

Profiles and templates are created, assigned, and deleted dynamically using the profile name and profile row status in each of the profile tables.

If the implementation allows modifying a profile or template while it is associated with a line, then such changes MUST take effect immediately. These changes MAY result in a restart (hard reset or soft restart) of the units on the line.

2.8.4. Managing Multiple Bearer Channels

The number of bearer channels is configured by setting the template attributes `adsl2LConfTempChan1ConfProfile`, `adsl2LConfTempChan2ConfProfile`, `adsl2LConfTempChan3ConfProfile`, and `adsl2LConfTempChan4ConfProfile` and then assigning that template to a DSL line using the `adsl2LineCnfgTemplate` attribute. When the number of bearer channels for a DSL line changes, the SNMP agent will automatically create or destroy rows in channel-related tables associated with that line. For example, when a DSL line is operating with one bearer channel, there will be zero rows in channel-related tables for channels two, three, and four. The SNMP agent MUST create and destroy channel-related rows as follows:

- o When the number of bearer channels for a DSL line changes to a higher number, the SNMP agent will automatically create rows in the `adsl2ChannelStatusTable`, and `adsl2PMChCurrTable` tables for that line.
- o When the number of bearer channels for a DSL line changes to a lower number, the SNMP agent will automatically destroy rows in the `adsl2ChannelStatusTable`, `adsl2PMChCurrTable`, `adsl2PMChHist15MinTable`, and `adsl2PMChHist1DTable` tables for that line.

2.9. Notifications

The ability to generate the SNMP notifications coldStart/warmStart (per [RFC3418]), which are per agent (e.g., per Digital Subscriber Line Access Multiplexer, or DSLAM, in such a device), and linkUp/linkDown (per [RFC2863]), which are per interface (i.e., ADSL/ADSL2 or ADSL2+ line), is REQUIRED.

A linkDown notification MAY be generated whenever any of ES, SES, CRC Anomaly, LOS, LOF, or UAS event occurs. The corresponding linkUp notification MAY be sent when all link failure conditions are cleared.

The notifications defined in this MIB module are for status change (e.g., initialization failure) and for the threshold crossings associated with the following events: full initialization failures, short initialization failures, ES, SES, FEC Seconds, LOS Seconds, UAS, FEC Seconds, FEC events, and CRC anomalies. Each threshold has its own enable/threshold value. When that value is 0, the notification is disabled.

The adsl2LineStatusAtur and adsl2LineStatusAtuc are bitmasks representing all outstanding error conditions associated with the ATU-R and ATU-C (respectively). Note that since the ATU-R status is obtained via the EOC, this information may be unavailable in case the ATU-R is unreachable via EOC during a line error condition. Therefore, not all conditions may always be included in its current status. Notifications corresponding to the bit fields in those two status objects are defined.

Note that there are other status parameters that refer to the ATU-R (e.g., downstream line attenuation). Those parameters also depend on the availability of EOC between the ATU-C and the ATU-R.

A threshold notification occurs whenever the corresponding current 15-minute interval error counter becomes equal to or exceeds the threshold value. Only one notification SHOULD be sent per interval per interface. Since the current 15-minute counter is reset to 0 every 15 minutes, if the condition persists, the notification may recur as often as every 15 minutes. For example, to get a notification whenever a "loss of" event occurs (but at most once every 15 minutes), set the corresponding threshold to 1. The agent will generate a notification when the event originally occurs.

Notifications, other than the threshold notifications listed above, SHOULD be rate-limited (throttled) such that there is an implementation-specific gap between the generation of consecutive notifications of the same event. When notifications are rate-

limited, they are dropped and not queued for sending at a future time. This is intended to be a general rate-limiting statement for notifications that otherwise have no explicit rate-limiting assertions in this document.

Note that the Network Management System, or NMS, may receive a linkDown notification, as well, if enabled (via ifLinkUpDownTrapEnable [RFC2863]). At the beginning of the next 15 minute interval, the counter is reset. When the first second goes by and the event occurs, the current interval bucket will be 1, which equals the threshold, and the notification will be sent again.

"
DESCRIPTION

"
This document defines a Management Information Base (MIB) module for use with network management protocols in the Internet community for the purpose of managing ADSL, ADSL2, and ADSL2+ lines. The MIB module described in RFC 2662 [RFC2662] describes objects used for managing Asymmetric Bit-Rate DSL (ADSL) interfaces per [T1E1.413], [G.992.1], and [G.992.2]. These object descriptions are based upon the specifications for the ADSL Embedded Operations Channel (EOC) as defined in American National Standards Institute (ANSI) T1E1.413/1995 [T1E1.413] and International Telecommunication Union (ITU-T) G.992.1 [G.992.1] and G.992.2 [G.992.2].

This document does not obsolete RFC 2662 [RFC2662], but rather provides a more comprehensive management model that includes the ADSL2 and ADSL2+ technologies per G.992.3, G.992.4, and G.992.5 ([G.992.3], [G.992.4], and [G.992.5], respectively). In addition, objects have been added to improve the management of ADSL, ADSL2, and ADSL2+ lines.

Additionally, the management framework for New Generation ADSL lines specified by the Digital Subscriber Line Forum (DSL Forum) has been taken into consideration [TR-90]. That framework is based on ITU-T G.997.1 standard [G.997.1] as well as two amendments: [G.997.1am1] and [G.997.1am2].

Note that the revised ITU-T G.997.1 standard also refers to the next generation of VDSL technology, known as VDSL2, per ITU-T G.993.2 [G.993.2]. However, managing VDSL2 lines is currently beyond the scope of this document.

The MIB module is located in the MIB tree under MIB 2 transmission, as discussed in the IANA Considerations section of this document.

Copyright (C) The Internet Society (2006). This version of this MIB module is part of RFC 4706: see the RFC itself for full legal notices."

DESCRIPTION
```

"Automode cold start forced. This parameter is defined in order to improve testing of the performance of ATUs supporting automode when it is enabled in the MIB. Change the value of this parameter to 'true' indicates a change in loop conditions applied to the devices under test. The ATUs shall reset any historical information used for automode and for shortening G.994.1 handshake

and initialization.

Automode is the case where multiple operation-modes are enabled through the adsl2LConfProfAtuTransSysEna object in the line configuration profile being used for the ADSL line, and where the selection of the actual operation-mode depends not only on the common capabilities of both ATUs (as exchanged in G.994.1), but also on achievable data rates under given loop conditions.

This object MUST be maintained in a persistent manner."

STATUS current

DESCRIPTION

"The table adsl2SCStatusTable contains status parameters of the ADSL2 sub-carriers. The following points apply to this table:

1. The main purpose of this table is to hold the results of a DELT.
2. This table also holds parameters obtained at line initialization time.
3. The rows in this table are volatile; that is, they are lost if the SNMP agent is rebooted.
4. Due to the large OCTET STRING attributes in this table, the worst case memory requirements for this table are very high. The manager may use the row status attribute of this table to delete rows in order to reclaim memory.
5. The manager may create rows in this table. The SNMP agent may create rows in this table. Only the manager may delete rows in this table.
6. The maximum number of rows allowable in this table is indicated by the scalar attribute adsl2ScalarSCMaxInterfaces.

- The number of rows available in this table is indicated by the scalar attribute `adsl2ScalarSCAvailInterfaces`.
7. The SNMP agent is permitted to create rows in this table when a DELT completes successfully or when line initialization occurs. It is not mandatory for the SNMP agent to create rows in this table; hence, it may be necessary for the manager to create rows in this table before any results can be stored.
 8. If the manager attempts to create a row in this table and there are no more rows available, the creation attempt will fail, and the response to the SNMP SET PDU will contain the error `noCreation(11)`.
 9. If the SNMP agent attempts to create a row in this table and there are no more rows available, the creation attempt will fail, and the attribute `adsl2LineCmndConflDsfFailReason` will indicate the reason for the failure. The failure reason will be either `tableFull(10)` or `noResources(11)`.
 10. An example of use of this table is as follows:
 - Step 1. : The DELT is started by setting the
 : `adsl2LineCmndConflDsf` from `inhibit` to `force`.
 - Step 2. : The DELT completes, and valid data is
 : available.
 - Step 3. : The row in the `adsl2SCStatusTable` where the
 : results will be stored does not yet exist so
 : the SNMP agent attempts to create the row.
 - Step 4. : Due to a low memory condition, a row in the
 : `adsl2SCStatusTable` table cannot be created at
 : this time.
 - Step 5. : The reason for the failure, `tableFull(10)`, is
 : indicated in the `adsl2LineCmndConflDsfFailReason`
 : attribute.
 11. Another example of use of this table is as follows :
 - Step 1. : The DELT is started by setting the
 : `adsl2LineCmndConflDsf` from `inhibit` to `force`.
 - Step 2. : The DELT completes and valid data is
 : available.
 - Step 3. : The row in the `adsl2SCStatusTable` where the
 : results will be stored does not yet exist so
 : the SNMP agent attempts to create the row.
 - Step 4. : The row creation is successful.
 - Step 5. : The value of the attribute
 : `adsl2LineCmndConflDsfFailReasonreason` is set
 : to `success(2)`.
 12. Another example of use of this table is as follows:
 - Step 1. : The manager creates a row in `adsl2SCStatusTable`
 : for a particular ADSL2 line.
 - Step 2. : The DELT is started on the above-mentioned

```

        : line by setting the adsl2LineCmndConfLdsf from
        : inhibit to force.
Step 3. : The DELT completes, and valid data is
        : available.
Step 4. : The value of the attribute
        : adsl2LineCmndConfLdsfFailReasonreason is set
        : to success(2).

MAX-ACCESS     not-accessible
STATUS         current
DESCRIPTION    "The table adsl2LineConfProfModeSpecTable extends the
               ADSL2 line configuration profile by ADSL Mode Specific
               parameters.
               A row in this table that has an index of

```

adsl2LConfProfAdslMode == defMode(1) is called a 'mandatory' row.
 A row in this table that has an index such that adsl2LConfProfAdslMode is not equal to defMode(1) is called an 'optional' row.
 When a row in the adsl2LineConfProfTable table (the parent row) is created, the SNMP agent will automatically create a 'mandatory' row in this table. When the parent row is deleted, the SNMP agent will automatically delete all associated rows in this table. Any attempt to delete the 'mandatory' row using the adsl2LConfProfModeSpecRowStatus attribute will be rejected by the SNMP agent.
 The manager MAY create an 'optional' row in this table using the adsl2LConfProfModeSpecRowStatus attribute if the parent row exists.
 The manager MAY delete an 'optional' row in this table using the adsl2LConfProfModeSpecRowStatus attribute at any time.
 If the actual transmission mode of a DSL line does not match one of the 'optional' rows in this table, then the line will use the PSD configuration from the 'mandatory' row.

Entries in this table MUST be maintained in a persistent manner."

DESCRIPTION

"The downstream PSD mask applicable at the U-C2 reference point.

This parameter is used only for G.992.5, and it may impose PSD restrictions (breakpoints) in addition to the Limit PSD mask defined in G.992.5.

This is a string of 32 pairs of values in the following structure:

Octets 0+1 - Index of 1st sub-carrier used in the context of a first breakpoint.

Octet 2 - The PSD reduction for the sub-carrier indicated in octets 0 and 1.

Octets 3-5 - Same, for a 2nd breakpoint.

Octets 6-8 - Same, for a 3rd breakpoint.

This architecture continues until octets 94-95, which are associated with a 32nd breakpoint.

Each subcarrier index is an unsigned number in the range 1 to NSCDs. Each PSD reduction value is in the range 0 (0dBm/Hz) to 255 (-127.5dBm/Hz) with steps of 0.5dBm/Hz. Valid values are in the range 0 to 190 (0 to -95dBm/Hz).

When the number of breakpoints is less than 32, all remaining octets are set to the value 0. Note that the content of this object should be correlated with the sub-carriers mask and with the RFI setup."

4. Implementation Analysis

A management application intended to manage ADSL links (e.g., G.992.1) with this MIB module must be modified to adapt itself to certain differences between RFC 2662 [RFC2662] and this MIB module, including the following aspects:

- o Although the configuration templates/profiles allow referring to 1-4 bearer channels, ADSL links are limited to 2 channels at most.
- o Although the channel configuration profile allows higher data rates, ADSL links are limited to downstream/upstream data rates as assumed in RFC 2662 [RFC2662].
- o The Impulse Noise Protection (INP) configuration parameters are given by minimum protection and maximum delay parameters.
- o The line configuration profile includes a sub-table that addresses mode-specific parameters. For ADSL links, the management application SHOULD create a row in that table for the 'adsl' mode.
- o The line configuration profile includes parameters that are irrelevant for ADSL links. Similarly, many status parameters in the MIB are irrelevant for certain ADSL modes. Therefore, it is advised to consult with ITU G.997.1 standard [G.997.1] regarding the scope and relevance of each parameter in this MIB.

5. Security Considerations

There are a number of management objects defined in this MIB module with a MAX-ACCESS clause of read-write and/or read-create. Such objects may be considered sensitive or vulnerable in some network environments. The support for SET operations in a non-secure environment without proper protection can have a negative effect on network operations. These are the tables and objects and their sensitivity/vulnerability:

- o adsl2LineTable

The table consists of the following objects that support SET operations:

- * adsl2LineCnfgTemplate
- * adsl2LineAlarmCnfgTemplate
- * adsl2LineCmndConfPmsf
- * adsl2LineCmndConfLdsf
- * adsl2LineCmndAutomodeColdStart

Unauthorized changes to `adsl2LineCnfgTemplate` could have a major adverse operational effect on many lines simultaneously.

Unauthorized changes to `adsl2LineAlarmCnfgTemplate` could have a contrary effect on notifications.

Unauthorized changes to `adsl2LineCmndConfPmsf` could have an adverse affect on the power consumption of a line and may disrupt an operational service.

Unauthorized changes to `adsl2LineCmndConfLdsf` could cause an unscheduled line test to be carried out on the line.

Unauthorized changes to `adsl2LineCmndAutomodeColdStart` could cause an unscheduled cold reset to the line.

- o `adsl2SCStatusTable`

This table contains one object, `adsl2SCStatusRowStatus`, that supports SET operations. Unauthorized changes could result in line test results being deleted prematurely.

- o `adsl2LineConfTemplateTable`

The table consists of the following objects that support SET operations:

- * `adsl2LConfTempLineProfile`
- * `adsl2LConfTempChan1ConfProfile`
- * `adsl2LConfTempChan1RaRatioDs`
- * `adsl2LConfTempChan1RaRatioUs`
- * `adsl2LConfTempChan2ConfProfile`
- * `adsl2LConfTempChan2RaRatioDs`
- * `adsl2LConfTempChan2RaRatioUs`
- * `adsl2LConfTempChan3ConfProfile`
- * `adsl2LConfTempChan3RaRatioDs`
- * `adsl2LConfTempChan3RaRatioUs`
- * `adsl2LConfTempChan4ConfProfile`
- * `adsl2LConfTempChan4RaRatioDs`
- * `adsl2LConfTempChan4RaRatioUs`
- * `adsl2LConfTempRowStatus`

Unauthorized changes to `adsl2LConfTempLineProfile`, `adsl2LConfTempChan1ConfProfile`, `adsl2LConfTempChan2ConfProfile`, `adsl2LConfTempChan3ConfProfile`, or `adsl2LConfTempChan4ConfProfile` could have an adverse operational effect on several lines; could

change several lines over to running in unwanted levels of operation; or could result in several services undergoing changes in the number of channels that carry the service.

Unauthorized changes to `adsl2LConfTempChan1RaRatioDs`, `adsl2LConfTempChan2RaRatioDs`, `adsl2LConfTempChan3RaRatioDs`, or `adsl2LConfTempChan4RaRatioDs`, would alter the relative rate allocations among all channels belonging to a line. This could have an adverse operational effect on several lines.

Unauthorized changes to `adsl2LConfTempRowStatus` could result in templates being created or brought into service prematurely; or could result in templates being inadvertently deleted or taken out of service.

o `adsl2LineConfProfTable`

The table consists of the following objects that support SET operations:

- * `adsl2LConfProfScMaskDs`
- * `adsl2LConfProfScMaskUs`
- * `adsl2LConfProfRfiBandsDs`
- * `adsl2LConfProfRaModeDs`
- * `adsl2LConfProfRaModeUs`
- * `adsl2LConfProfRaUsNrmDs`
- * `adsl2LConfProfRaUsNrmUs`
- * `adsl2LConfProfRaUsTimeDs`
- * `adsl2LConfProfRaUsTimeUs`
- * `adsl2LConfProfRaDsNrmsDs`
- * `adsl2LConfProfRaDsNrmsUs`
- * `adsl2LConfProfRaDsTimeDs`
- * `adsl2LConfProfRaDsTimeUs`
- * `adsl2LConfProfTargetSnrmDs`
- * `adsl2LConfProfTargetSnrmUs`
- * `adsl2LConfProfMaxSnrmDs`
- * `adsl2LConfProfMaxSnrmUs`
- * `adsl2LConfProfMinSnrmDs`
- * `adsl2LConfProfMinSnrmUs`
- * `adsl2LConfProfMsgMinUs`
- * `adsl2LConfProfMsgMinDs`
- * `adsl2LConfProfAtuTransSysEna`
- * `adsl2LConfProfPmMode`
- * `adsl2LConfProfL0Time`
- * `adsl2LConfProfL2Time`
- * `adsl2LConfProfL2Atpr`
- * `adsl2LConfProfL2Atprt`
- * `adsl2LConfProfRowStatus`

Unauthorized changes resulting in the setting of any of the above objects to an incorrect value could have an adverse operational effect on several lines.

Also, unauthorized changes to `adsl2LConfProfRowStatus` could result in unwanted line profiles being created or brought into service prematurely; or could result in line profiles being inadvertently deleted or taken out of service.

o `adsl2LineConfProfModeSpecTable`

The table consists of the following objects that support SET operations:

- * `adsl2LConfProfMaxNomPsdDs`
- * `adsl2LConfProfMaxNomPsdUs`
- * `adsl2LConfProfMaxNomAtpDs`
- * `adsl2LConfProfMaxNomAtpUs`
- * `adsl2LConfProfMaxAggRxPwrUs`
- * `adsl2LConfProfPsdMaskDs`
- * `adsl2LConfProfPsdMaskUs`
- * `adsl2LConfProfPsdMaskSelectUs`
- * `adsl2LConfProfModeSpecRowStatus`

Unauthorized changes resulting in the setting of any of the above objects to an incorrect value could have an adverse operational effect on several lines.

Also, unauthorized changes to `adsl2LConfProfModeSpecRowStatus` could result in unwanted PSD configurations being created or brought into service prematurely; or could result in PSD configurations being inadvertently deleted or taken out of service.

o `adsl2ChConfProfileTable`

The table consists of the following objects that support SET operations:

- * `adsl2ChConfProfMinDataRateDs`
- * `adsl2ChConfProfMinDataRateUs`
- * `adsl2ChConfProfMinResDataRateDs`
- * `adsl2ChConfProfMinResDataRateUs`
- * `adsl2ChConfProfMaxDataRateDs`
- * `adsl2ChConfProfMaxDataRateUs`
- * `adsl2ChConfProfMinDataRateLowPwrDs`
- * `adsl2ChConfProfMaxDelayDs`
- * `adsl2ChConfProfMaxDelayUs`

- * adsl2ChConfProfMinProtectionDs
- * adsl2ChConfProfMinProtectionUs
- * adsl2ChConfProfMaxBerDs
- * adsl2ChConfProfMaxBerUs
- * adsl2ChConfProfUsDataRateDs
- * adsl2ChConfProfDsDataRateDs
- * adsl2ChConfProfUsDataRateUs
- * adsl2ChConfProfDsDataRateUs
- * adsl2ChConfProfImaEnabled
- * adsl2ChConfProfRowStatus

Unauthorized changes resulting in the setting of any of the above objects to an incorrect value could have an adverse operational effect on several lines.

Also, unauthorized changes to adsl2ChConfProfRowStatus could result in unwanted channel profiles being created or brought into service prematurely; or could result in channel profiles being inadvertently deleted or taken out of service.

o adsl2LineAlarmConfTemplateTable

The table consists of the following objects that support SET operations:

- * adsl2LAlarmConfTempLineProfile
- * adsl2LAlarmConfTempChan1ConfProfile
- * adsl2LAlarmConfTempChan2ConfProfile
- * adsl2LAlarmConfTempChan3ConfProfile
- * adsl2LAlarmConfTempChan4ConfProfile
- * adsl2LAlarmConfTempRowStatus

Unauthorized changes to adsl2LAlarmConfTempLineProfile, adsl2LAlarmConfTempChan1ConfProfile, adsl2LAlarmConfTempChan2ConfProfile, adsl2LAlarmConfTempChan3ConfProfile, or adsl2LAlarmConfTempChan4ConfProfile could have an adverse effect on the management of notifications generated at the scope of several to many lines; or could change several to many lines over to running with unwanted management rates for generated notifications.

Unauthorized changes to adsl2LAlarmConfTempRowStatus could result in alarm templates being created or brought into service prematurely; or could result in alarm templates being inadvertently deleted or taken out of service.

o adsl2LineAlarmConfProfileTable

The table consists of the following objects that support SET operations:

- * adsl2LineAlarmConfProfileAtucThresh15MinFecs
- * adsl2LineAlarmConfProfileAtucThresh15MinEs
- * adsl2LineAlarmConfProfileAtucThresh15MinSes
- * adsl2LineAlarmConfProfileAtucThresh15MinLoss
- * adsl2LineAlarmConfProfileAtucThresh15MinUas
- * adsl2LineAlarmConfProfileAturThresh15MinFecs
- * adsl2LineAlarmConfProfileAturThresh15MinEs
- * adsl2LineAlarmConfProfileAturThresh15MinSes
- * adsl2LineAlarmConfProfileAturThresh15MinLoss
- * adsl2LineAlarmConfProfileAturThresh15MinUas
- * adsl2LineAlarmConfProfileThresh15MinFailedFullInt
- * adsl2LineAlarmConfProfileThresh15MinFailedShrtInt
- * adsl2LineAlarmConfProfileRowStatus

Increasing any of the threshold values could result in a notification being suppressed or deferred. Setting a threshold to 0 could result in a notification being suppressed. Suppressing or deferring a notification could prevent the timely delivery of important diagnostic information. Decreasing any of the threshold values could result in a notification being sent from the network falsely reporting a threshold crossing.

Changing a threshold value could also have an impact on the amount of notifications the agent sends. The Notifications Section of this document has a paragraph that provides general guidance on the rate-limiting of notifications. Agent implementations not providing rate-limiting could result in notifications being generated at an uncontrolled rate. Unauthorized changes to a threshold value could result in an undesired notification rate.

Unauthorized changes to row status could result in unwanted line alarm profiles being created or brought into service. Also, changes to the row status could result in line alarm profiles being inadvertently deleted or taken out of service.

o adsl2ChAlarmConfProfileTable

The table consists of the following objects that support SET operations:

- * adsl2ChAlarmConfProfileAtucThresh15MinCodingViolations
- * adsl2ChAlarmConfProfileAtucThresh15MinCorrected
- * adsl2ChAlarmConfProfileAturThresh15MinCodingViolations
- * adsl2ChAlarmConfProfileAturThresh15MinCorrected
- * adsl2ChAlarmConfProfileRowStatus
- * adsl2LineAlarmConfProfileAturThresh15MinFecs
- * adsl2LineAlarmConfProfileAturThresh15MinEs
- * adsl2LineAlarmConfProfileAturThresh15MinSes
- * adsl2LineAlarmConfProfileAturThresh15MinLoss
- * adsl2LineAlarmConfProfileAturThresh15MinUas
- * adsl2LineAlarmConfProfileThresh15MinFailedFullInt
- * adsl2LineAlarmConfProfileThresh15MinFailedShrtInt
- * adsl2LineAlarmConfProfileRowStatus

Increasing any of the threshold values could result in a notification being suppressed or deferred. Setting a threshold to 0 could result in a notification being suppressed. Suppressing or deferring a notification could prevent the timely delivery of important diagnostic information. Decreasing any of the threshold values could result in a notification being sent from the network falsely reporting a threshold crossing.

Changing a threshold value could also have an impact on the amount of notifications the agent sends. The Notifications Section of this document has a paragraph that provides general guidance on the rate-limiting of notifications. Agent implementations not providing rate-limiting could result in notifications being generated at an uncontrolled rate. Unauthorized changes to a threshold value could result in an undesired notification rate.

Unauthorized changes to row status could result in unwanted channel alarm profiles being created or brought into service. Also, changes to the row status could result in channel alarm profiles being inadvertently deleted or taken out of service.

Some of the readable objects in this MIB module (i.e., objects with a MAX-ACCESS other than not-accessible) may be considered sensitive or vulnerable in some network environments. It is thus important to control even GET and/or NOTIFY access to these objects and possibly to even encrypt the values of these objects when sending them over the network via SNMP. These are the tables and objects and their sensitivity/vulnerability:

- o adsl2LineInventoryTable

Access to these objects would allow an intruder to obtain information about which vendor's equipment is in use on the network. Further, such information is considered sensitive in many environments for competitive reasons.

- * adsl2LInvG994VendorId
- * adsl2LInvSystemVendorId
- * adsl2LInvVersionNumber
- * adsl2LInvSerialNumber
- * adsl2LInvSelfTestResult
- * adsl2LInvTransmissionCapabilities

SNMP versions prior to SNMPv3 did not include adequate security. Even if the network itself is secure (for example by using IPsec), even then, there is no control as to who on the secure network is allowed to access and GET/SET (read/change/create/delete) the objects in this MIB module.

It is RECOMMENDED that implementers consider the security features as provided by the SNMPv3 framework (see [RFC3410], Section 8), including full support for the SNMPv3 cryptographic mechanisms (for authentication and privacy).

It is RECOMMENDED to deploy SNMPv3 and to enable cryptographic security. It is then a customer/operator responsibility to ensure that the SNMP entity giving access to an instance of this MIB module is properly configured to give access only to those objects whose principals (users) have legitimate rights to indeed GET or SET (change/create/delete) them.

6. Acknowledgements

The authors are deeply grateful to the authors of the HDSL2 LINE MIB (RFC 4319), Clay Sikes and Bob Ray, for contributing to accelerating the work on this document. The structure of this document as well as several paragraphs originate in their document.

Special thanks to Bert Wijnen for his meticulous review of this text.

Other contributions and advice were received from the following:

Bert Wijnen	(Lucent)
Bob Ray	(Pesa)
Chen Jian	(Huawei)
Clay Sikes	(Zhone)
Mauro Molinari	(Marconi)
Narendranath Nair	(Wipro)
Randy Presuhn	(Mindspring)
