## Management Information Base for Frame Relay DTEs Using SMIV2

### 1. Status of this Memo

This document specifies an Internet standards track protocol for the Internet community, and requests discussion and suggestions for improvements. Please refer to the current edition of the "Internet Official Protocol Standards" (STD 1) for the standardization state and status of this protocol. Distribution of this memo is unlimited.

### 2. Abstract

This memo defines a portion of the Management Information Base (MIB) for use with network management protocols in TCP/IP- based internets. In particular, it defines objects for managing Frame Relay interfaces on DTEs.

### 3. The SNMPv2 Network Management Framework

The major components of the SNMPv2 Network Management framework are described in the documents listed below.

- o RFC 1902 [1] defines the Structure of Management Information (SMI), the mechanisms used for describing and naming objects for the purpose of management.
- o STD 17, RFC 1213 [2] defines MIB-II, the core set of managed objects (MO) for the Internet suite of protocols.
- o RFC 1905 [3] defines the protocol used for network access to managed objects.

The framework is adaptable/extensible by defining new MIBs to suit the requirements of specific applications/protocols/situations.

Managed objects are accessed via a virtual information store, the MIB. Objects in the MIB are defined using the subset of Abstract Syntax Notation One (ASN.1) defined in the SMI. In particular, each object type is named by an OBJECT IDENTIFIER, which is an administratively assigned name. The object type together with an object instance serves to uniquely identify a specific instantiation of the object. For human convenience, often a textual string, termed the descriptor, is used to refer to the object type.

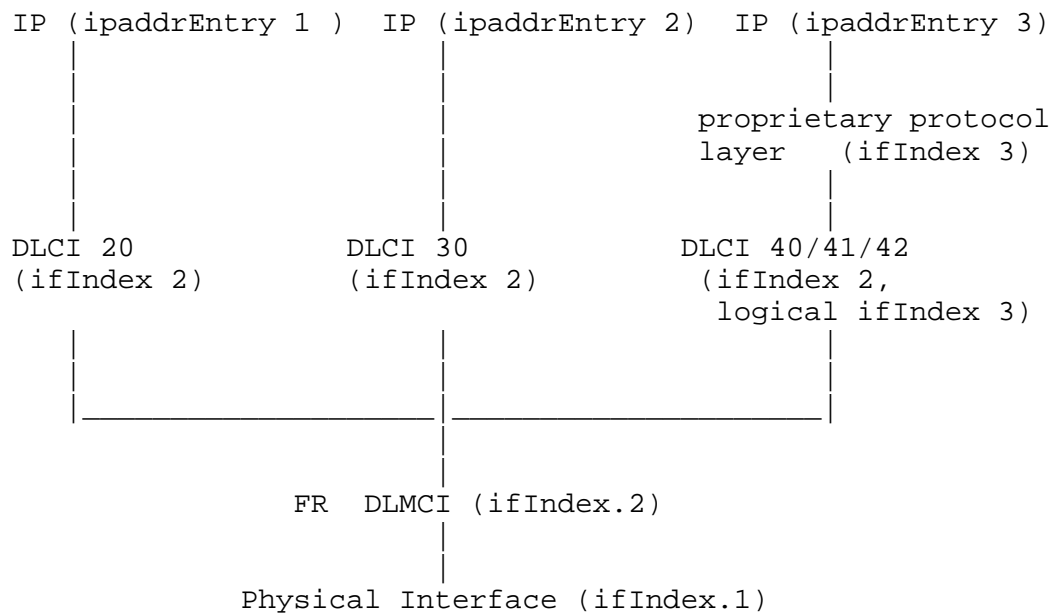

### 4. Overview

#### 4.1. Frame Relay Operational Model

For the purposes of understanding this document, Frame Relay is viewed as a multi-access media, not as a group of point-to-point connections. This model proposes that Frame Relay is a single interface to the network (physical connection) with many destinations or neighbors (virtual connections). This view enables a network manager the ability to group all virtual connections with their corresponding physical connection thereby allowing simpler diagnostics and trouble shooting.

With the extension of the interfaces MIB, it is possible to configure frame relay DLCs as individual interfaces and create ifTable entries for each. This is not recommended and is not directly supported by this MIB. Additionally, in the presence of demand circuits creation of individual ifEntries for each is not possible.

Should the user wish to group DLCs together to associate them with a higher layer, or to associate a DLC with an unnumbered point-to-point service, the frame relay DTE MIB provides an entry in the frCircuitEntry record. For example, suppose one were to configure a company proprietary protocol to run above several of the frame relay VCs. The basic layering would look something like the following:

A configuration which specified that DLCI 40, 41, and 42 were associated with a proprietary protocol layer, while DLCI 20 and 30 were to run IP directly can now be expressed using a combination of frCircuitIfIndex and frCircuitLogicalIfIndex. In this particular case DLCIs 40, 41 and 42 would use frCircuitIfIndex equal to the frame relay interface level (2) while their frCircuitLogicalIfIndex would indicate the proprietary protocol (3). DLCIs 20 and 30 would have both instances set to the frame relay interface (2).

Object	Meaning for Frame Relay Interface
ifDescr	As per DESCRIPTION in RFC 1573.
ifType	The value allocated for Frame Relay Interfaces - frameRelay (32).
ifMtu	Set to maximum frame size in octets for this frame relay interface.

ifSpeed	The access rate for the frame relay interface. This could be different from the speed of the underlying physical interface, e.g. in a fractional T1 case the access rate could be 384 kbits/s (the value reported in this object) whereas the speed of the underlying interface would be 1.544 Mbits/s (the value reported in the instance of ifSpeed for the ifEntry with type ds1).
ifPhysAddress	The primary address for this interface assigned by the Frame Relay interface provider. An octet string of zero length if no address is used for this interface.
ifAdminStatus	As per DESCRIPTION in RFC 1573.
ifOperStatus	As per DESCRIPTION in RFC 1573.
ifLastChange	As per DESCRIPTION in RFC 1573.
ifInOctets	The number of received octets. This includes not only the information field (user data) but also the frame relay header and CRC.
ifInUcastPkts	The number of frames received on non-multicast DLCIs
ifInDiscards	The number of frames that were successfully received but were discarded because of format errors or because the VC was not known. Format errors, in this case, are any errors which would prevent the system from recognizing the DLCI and placing the error in the frCircuitDiscard category.
ifInErrors	The number of received frames that are discarded, because of an error. Possible errors can be the following: the frame relay frames were too long or were too short, the frames had an invalid or unrecognized DLCI values, or incorrect header values.

`ifInUnknownProtos` Number of unknown or unsupported upper layer protocol frames received and discarded.

`ifOutOctets` The number of received octets. This includes not only the information field (user data) but also the frame relay header and CRC.

`ifOutUcastpkts` The number of frames sent.

`ifOutDiscards` The number of frames discarded in the transmit direction.

`ifOutErrors` The number of frames discarded in the egress direction, because of errors.

`ifName` As per DESCRIPTION in RFC 1573.

`ifInMulticastPkts` The number of unerrored frames received on a multicast DLCI.

`ifInBroadcastPkts` Always zero (0) as there are no broadcast frames.

`ifOutMulticastPkts` The number of frames transmitted over a multicast DLCI.

`ifOutBroadcastPkts` Always zero (0) as there are no broadcast frames.

`ifHCInOctets` Only required when `ifSpeed`  $\geq$  155 Mbits/s.  
See details for `ifInOctets`.

`ifHCOctets` Only required when `ifSpeed`  $\geq$  155 Mbits/s.  
See details for `ifInOctets`.

`ifLinkUpDownTrapEnable` As per DESCRIPTION in RFC 1573.

`ifHighSpeed` The access rate of the frame relay interface measured in Mbits/s. If the access rate is less than 1 Mbits/s, this object returns 0.

`ifPromiscuousMode` Set to false(2).

`ifConnectorPresent` Set to false(2).

## 4.2. Textual Conventions

One new data type is introduced as a textual convention in this MIB document. This textual convention enhances the readability of the specification and can ease comparison with other specifications if appropriate. It should be noted that the introduction of this textual conventions has no effect on either the syntax nor the semantics of any managed objects. The use of this is merely an artifact of the explanatory method used. Objects defined in terms of one of these methods are always encoded by means of the rules that define the primitive type. Hence, no changes to the SMI or the SNMP are necessary to accommodate this textual conventions which is adopted merely for the convenience of readers and writers in pursuit of the elusive goal of clear, concise, and unambiguous MIB documents.

The new data type is DLCI. DLCI refers to the range 0..DLCINumber, and is used to refer to the valid Data Link Connection Indices. DLCINumber is, by definition, the largest possible DLCI value possible under the configured Q.922 Address Format.

## 4.3. Structure of MIB

The MIB is composed of three groups, one defining the Data Link Connection Management Interface (DLCMI), one describing the Circuits, and a third describing errors.

During normal operation, Frame Relay virtual circuits will be added, deleted and change availability. The occurrence of such changes is of interest to the network manager and therefore, one trap is defined, intended to be corollary to the SNMP "Link Up" and "Link Down" traps.

## 5. Changes from RFC 1315

Below are listed the changes from the previously published version this document, which was RFC 1315:

- o The MIB module was converted from SMIV1 to SMIV2 format. Note: due to this, the table indices have access of "read-only" instead of "not-accessible", which is the typical value for index objects in SMIV2.
- o The module name was changed from RFC1315-MIB to FRAME-RELAY-DTE-MIB.
- o The textual convention "Index" was dropped from the MIB module and "InterfaceIndex" from the interfaces MIB module, IF-MIB, was used in its place.

- o Objects `frDlcmiStatus` and `frDlcmiRowStatus` were added to table `frDlcmiTable`.
- o Added values `"itut933A(5)"` (from CCITT Q933 Annex A) and `"ansiT1617D1994(6)"` (from ANSI T1.617a-1994 Annex D) to the enumerations for object `frDlcmiState`.
- o The labels for the enumerated values for object `frDlcmiAddressLen` were renamed to remove their hyphens as required by SMIv2.
- o Added clarification that the "management virtual circuit" (i.e. DLCI 0) is a member of the circuit table.
- o Added the following objects to table `frCircuitTable`: `frCircuitMulticast`, `frCircuitType`, `frCircuitDiscards`, `frCircuitReceivedDEs`, `frCircuitSentDEs`, `frCircuitLogicalIfIndex`, and `frCircuitRowStatus`.
- o The definition of object `frCircuitReceivedOctets` was clarified as to which octets were counted.
- o Added the objects `frErrFaults` and `frErrFaultTime` to table `frErrTable`.
- o Added clarification to the values of object `frErrType`.
- o Added size on definition of object `frErrData` and clarified what data to capture.
- o Changed identifier for OID value { `frameDelayDTE 4` } from `frame-relay-globals` to `frameRelayTrapControl`.
- o Added object `frTrapMaxRate`.
- o Created object groups `frPortGroup`, `frCircuitGroup`, `frTrapGroup`, `frErrGroup`, `frPortGroup0`, `frCircuitGroup0`, `frTrapGroup0`, and `frErrGroup0`.
- o Created notification group `frNotificationGroup`.
- o Created module compliances `frCompliance` and `frCompliance0`.
- o Added ranges to objects `frCircuitCommittedBurst`, `frCircuitExcessBurst`, and `frCircuitThroughput`.

"Number of frames received over this virtual circuit since it was created."

::= { frCircuitEntry 8 }

## frCircuitReceivedOctets OBJECT-TYPE

SYNTAX Counter32

MAX-ACCESS read-only

STATUS current

## DESCRIPTION

"Number of octets received over this virtual circuit since it was created. Octets counted include the full frame relay header, but do not include the flag characters or the CRC."

::= { frCircuitEntry 9 }

## frCircuitCreationTime OBJECT-TYPE

SYNTAX TimeStamp

MAX-ACCESS read-only

STATUS current

## DESCRIPTION

"The value of sysUpTime when the virtual circuit was created, whether by the Data Link Connection Management Interface or by a SetRequest."

::= { frCircuitEntry 10 }

**frCircuitLastTimeChange OBJECT-TYPE**

SYNTAX    TimeStamp

MAX-ACCESS   read-only

STATUS    current

DESCRIPTION

"The value of sysUpTime when last there was a change in the virtual circuit state"

::= { frCircuitEntry 11 }

**frCircuitCommittedBurst OBJECT-TYPE**

SYNTAX    Integer32(0..2147483647)

MAX-ACCESS   read-create

STATUS    current

DESCRIPTION

"This variable indicates the maximum amount of data, in bits, that the network agrees to transfer under normal conditions, during the measurement interval."

REFERENCE

"American National Standard T1.617-1991, Section 6.5.19"

DEFVAL    { 0 } -- the default indicates no commitment

::= { frCircuitEntry 12 }

**frCircuitExcessBurst OBJECT-TYPE**

SYNTAX    Integer32(0..2147483647)

MAX-ACCESS   read-create

STATUS    current

DESCRIPTION

"This variable indicates the maximum amount of uncommitted data bits that the network will attempt to deliver over the measurement interval."

By default, if not configured when creating the entry, the Excess Information Burst Size is set to the value of ifSpeed."

REFERENCE

"American National Standard T1.617-1991, Section 6.5.19"

::= { frCircuitEntry 13 }

**frCircuitThroughput OBJECT-TYPE**

SYNTAX    Integer32(0..2147483647)

MAX-ACCESS   read-create

STATUS    current

DESCRIPTION

"Throughput is the average number of 'Frame Relay Information Field' bits transferred per second across a user network interface in one direction, measured over the measurement interval.

If the configured committed burst rate and throughput are both non-zero, the measurement interval, T, is

$T = \text{frCircuitCommittedBurst} / \text{frCircuitThroughput}.$

If the configured committed burst rate and throughput are both zero, the measurement interval, T, is

$T = \text{frCircuitExcessBurst} / \text{ifSpeed}.$ "

#### REFERENCE

"American National Standard T1.617-1991, Section 6.5.19"

DEFVAL {0} -- the default value of Throughput is  
-- "no commitment".

::= { frCircuitEntry 14 }

    unicast (1),  
    oneWay (2),  
    twoWay (3),  
    nWay (4)  
}

MAX-ACCESS read-create

STATUS current

#### DESCRIPTION

"This indicates whether this VC is used as a unicast VC (i.e. not multicast) or the type of multicast service subscribed to"

#### REFERENCE

"Frame Relay PVC Multicast Service and Protocol Description Implementation: FRF.7 Frame Relay Forum Technical Committee October 21, 1994"

DEFVAL {unicast}

-- the default value of frCircuitMulticast is  
-- "unicast" (not a multicast VC).

::= { frCircuitEntry 15 }

#### frCircuitType OBJECT-TYPE

SYNTAX INTEGER {  
    static (1),  
    dynamic (2)  
}

MAX-ACCESS read-only  
STATUS current  
DESCRIPTION  
    "Indication of whether the VC was manually created  
    (static), or dynamically created (dynamic) via the data  
    link control management interface."  
::= { frCircuitEntry 16 }

frCircuitDiscards OBJECT-TYPE  
SYNTAX Counter32  
MAX-ACCESS read-only  
STATUS current  
DESCRIPTION  
    "The number of inbound frames dropped because of format  
    errors, or because the VC is inactive."  
::= { frCircuitEntry 17 }

frCircuitReceivedDEs OBJECT-TYPE  
SYNTAX Counter32  
MAX-ACCESS read-only  
STATUS current  
DESCRIPTION  
    "Number of frames received from the network indicating  
    that they were eligible for discard since the virtual  
    circuit was created. This occurs when the remote DTE  
    sets the DE flag, or when in remote DTE's switch  
    detects that the frame was received as Excess Burst  
    data."  
REFERENCE  
    "American National Standard T1.618-1991, Section 3.3.4"  
::= { frCircuitEntry 18 }

frCircuitSentDEs OBJECT-TYPE  
SYNTAX Counter32  
MAX-ACCESS read-only  
STATUS current  
DESCRIPTION  
    "Number of frames sent to the network indicating that  
    they were eligible for discard since the virtual  
    circuit was created. This occurs when the local DTE  
    sets the DE flag, indicating that during Network  
    congestion situations those frames should be discarded  
    in preference of other frames sent without the DE bit  
    set."  
REFERENCE

"American National Standard T1.618-1991, Section 3.3.4"  
 ::= { frCircuitEntry 19 }

frCircuitLogicalIfIndex OBJECT-TYPE

SYNTAX InterfaceIndex

MAX-ACCESS read-create

STATUS current

DESCRIPTION

"Normally the same value as frDlcmiIfIndex, but different when an implementation associates a virtual ifEntry with a DLC or set of DLCs in order to associate higher layer objects such as the ipAddrEntry with a subset of the virtual circuits on a Frame Relay interface. The type of such ifEntries is defined by the higher layer object; for example, if PPP/Frame Relay is implemented, the ifType of this ifEntry would be PPP. If it is not so defined, as would be the case with an ipAddrEntry, it should be of type Other."

::= { frCircuitEntry 20 }

frCircuitRowStatus OBJECT-TYPE

SYNTAX RowStatus

MAX-ACCESS read-create

STATUS current

DESCRIPTION

"This object is used to create a new row or modify or destroy an existing row in the manner described in the definition of the RowStatus textual convention. Writable objects in the table may be written in any RowStatus state."

::= { frCircuitEntry 21 }

    }

```

MAX-ACCESS read-only  
STATUS current  
DESCRIPTION

"The type of error that was last seen on this interface:

receiveShort: frame was not long enough to allow  
demultiplexing - the address field was incomplete,  
or for virtual circuits using Multiprotocol over  
Frame Relay, the protocol identifier was missing  
or incomplete.

receiveLong: frame exceeded maximum length configured for this  
interface.

illegalAddress: address field did not match configured format.

unknownAddress: frame received on a virtual circuit which was not  
active or administratively disabled.

dlcmlProtoErr: unspecified error occurred when attempting to  
interpret link maintenance frame.

dlcmlUnknownIE: link maintenance frame contained an Information  
Element type which is not valid for the  
configured link maintenance protocol.

dlcmlSequenceErr: link maintenance frame contained a sequence  
number other than the expected value.

dlcmlUnknownRpt: link maintenance frame contained a Report Type  
Information Element whose value was not valid  
for the configured link maintenance protocol.

noErrorSinceReset: no errors have been detected since the last  
cold start or warm start."

::= { frErrEntry 2 }

## 7. Security Issues

Security issues for this MIB are entirely covered by the SNMP Security Architecture, and have not been expanded within the contents of this MIB.

## 8. Acknowledgments

This document was originally produced by the IP Over Large Public Data Networks (IPLPDN) Working Group, and has since been carried on in the PPP Working Group, sort of. Currently, the Ion Working Group is its host.

Special thanks to James Watt of Newbridge Networks for his fine suggestions and pastable text.
