Definitions of Managed Objects for ATM Management

Status of this Memo

Copyright Notice

Table of Contents

1. Abstract

This memo defines a portion of the Management Information Base (MIB) for use with network management protocols in the Internet community. In particular, it describes objects used for managing ATM-based interfaces, devices, networks and services.

This memo replaces RFC 1695 [24]. Changes relative to RFC 1695 are summarized in the MIB module's REVISION clause.

Textual Conventions used in this MIB are defined in [6] and [19].

2. The SNMP Network Management Framework

The SNMP Management Framework presently consists of five major components:

0 An overall architecture, described in RFC 2271 [1].

0 Mechanisms for describing and naming objects and events for the purpose of management. The first version of this Structure of Management Information (SMI) is called SMIv1 and described in STD 16, RFC 1155 [2], STD 16, RFC 1212 [3] and RFC 1215 [4]. The second version, called SMIv2, is described in RFC 1902 [5], RFC 1903 [6] and RFC 1904 [7].

0 Message protocols for transferring management information. The first version of the SNMP message protocol is called SNMPv1 and described in STD 15, RFC 1157 [8]. A second version of the SNMP message protocol, which is not an Internet standards track protocol, is called SNMPv2c and described in RFC 1901 [9] and RFC 1906 [10].

The third version of the message protocol is called SNMPv3 and described in RFC 1906 [10], RFC 2272 [11] and RFC 2274 [12].

0 Protocol operations for accessing management information. The first set of protocol operations and associated PDU formats is described in STD 15, RFC 1157 [8]. A second set of protocol operations and associated PDU formats is described in RFC 1905 [13].

0 A set of fundamental applications described in RFC 2273 [14] and the view-based access control mechanism described in RFC 2275 [15].

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. Objects in the MIB are defined using the mechanisms defined in the SMI.

This memo specifies a MIB module that is compliant to the SMIv2. A MIB conforming to the SMIv1 can be produced through the appropriate translations. The resulting translated MIB must be semantically equivalent, except where objects or events are omitted because no translation is possible (e.g., use of Counter64). Some machine readable information in SMIv2 will be converted into textual descriptions in SMIv1 during the translation process. However, this loss of machine readable information is not considered to change the semantics of the MIB.

3. ATM Terminology

Some basic ATM terminologies are described in this section to facilitate defining the ATM managed objects.

3.1. VCL/VPL and VCC/VPC

There are two distinct types of ATM virtual connections: Virtual Channel Connections (VCCs) and Virtual Path Connection (VPCs). As shown in Figures 1 and 2, ATM virtual connections consist of concatenated series of virtual links which forms a path between two end points, with each concatenation occurring at an ATM switch. Virtual links of VCCs are called Virtual Channel Links (VCLs). Virtual links of VPCs are called Virtual Path Links (VPLs). The VCI and VPI fields in the ATM cell header associate each cell of a VCC with a particular VCL over a given physical link. The VPI field in the ATM cell header associates each cell of a VPC with a particular VPL over a given physical link. Switches route cells between VCLs (or VPLs) via a cross-connect function according to the cells' VCI/VPI (or VPI) values.

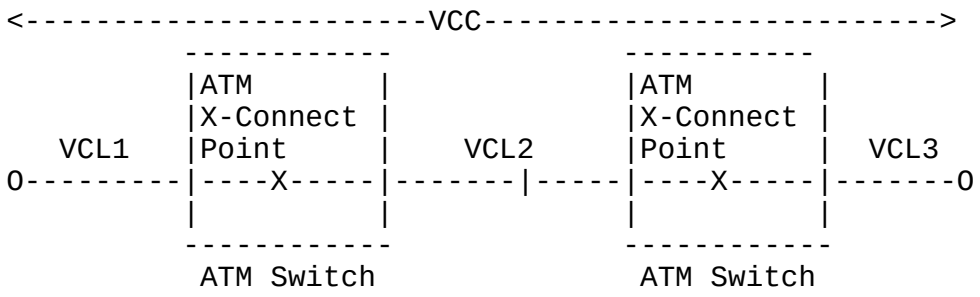

Figure 1: Virtual Channel Links and
Virtual Channel Connection

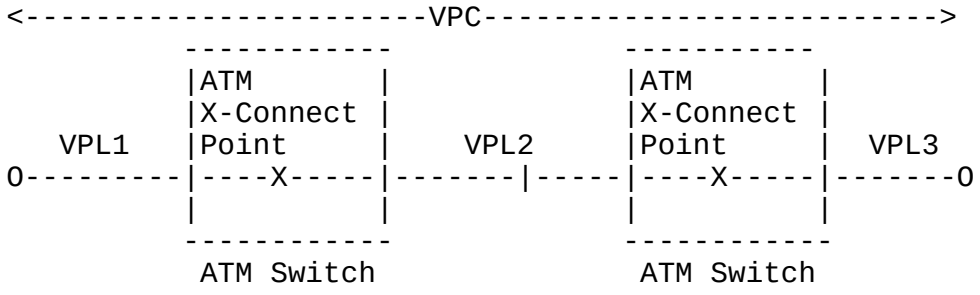

Figure 2: Virtual Path Links and
Virtual Path Connection

A single ATM end-system or switch does not support the whole end-to-end span of a VCC (or VPC). Rather, multiple ATM end-systems and/or switches each support one piece of the VCC (or VPC). That is, each ATM end-system (or ATM switch) at one end of the VCC/VPC supports its end of the VCC/VPC plus the VCL or VPL on its external interface, and each switch through which the VCC/VPC passes supports the pair of VCLs/VPLs on its external interfaces as well as the cross-connection of those VCLs/VPLs. Thus, the end-to-end management of a VCC or VPC is achieved only by appropriate management of its individual pieces in combination.

Note that for management purposes, an ATM network may be viewed as a large distributed switch by hiding all the network's internal connectivity as being internal to the distributed switch (as shown in Figure 2a). This model may for example be used for Customer Network Management (CNM) purposes.

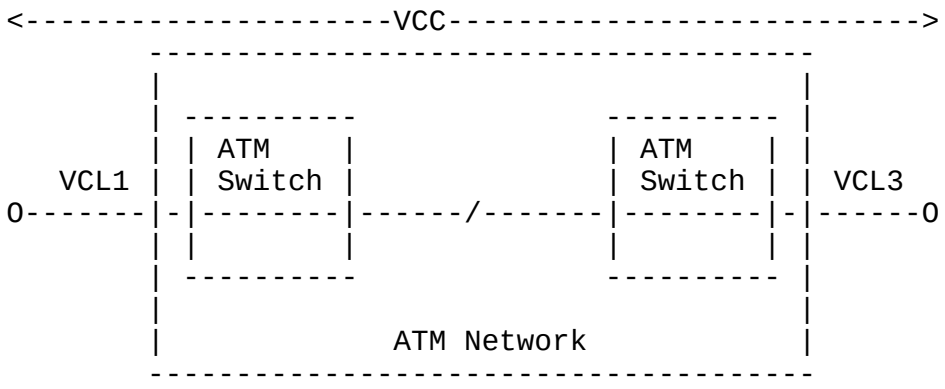

Figure 2a: ATM Network modeled as a large distributed switch

A VCC has a set of traffic characteristics (i.e., bandwidth parameters, service category parameters, etc.). VCLs inherit their traffic characteristics from the VCC of which they are a part. VCCs are bi-directional by definition. However, the traffic parameters in the two directions of a connection can be symmetric or asymmetric, i.e., the two directions can have the same or different traffic flows. A uni-directional traffic flow across a VCC is achieved by assigning a zero bandwidth in one direction. Note that in addition to the bandwidth required by the user traffic flow, bandwidth is also required for OAM cell flows, even for the zero-bandwidth direction of a uni-directional connection. These same principles apply to VPCs.

3.2. PVC, SVC and Soft PVC

A Permanent Virtual Connection (PVC) is a provisioned VCC or VPC. A Switched Virtual Connection (SVC) is a switched VCC or VPC that is set up in real-time via call set-up signaling procedures. A PVC (or an SVC) can be a point-to-point, point-to-multipoint, or multipoint-to-multipoint VCC or VPC. A Soft PVC is a connection of which portions are switched, while other portions are permanent (see Figure 3 and [22]).

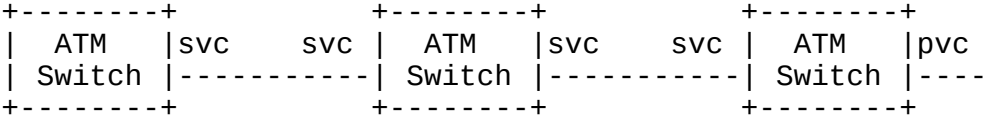

Figure 3: An example of a Soft PVC

3.3. Traffic Management Parameters

3.3.1. Traffic Policing and Traffic Shaping Parameters

In order to allocate resources fairly among different users, some networks police traffic at resource access points. The traffic enforcement or policing taken at a UNI is called Usage Parameter Control (UPC) and is conceptually activated on an incoming VCL or VPL as shown in Figure 4. The use of the traffic enforcer at the ingress of the connection is to make sure that the user traffic does not exceed the negotiated traffic parameters such as the peak cell rate associated with a specific traffic descriptor type.

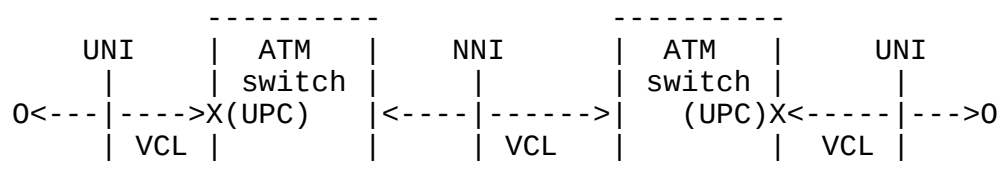

Figure 4: An Example of a UPC

In addition, traffic shaping may be performed on an outgoing VPL or VCL at a given ATM interface. The function of the ATM traffic shaper, conceptually either at the source or an egress point of the connection, is to smooth the outgoing cell traffic inter-arrival time. If policing or shaping is not performed then the policing or shaping algorithm is not activated.

3.3.2. Cell Loss Priority

To prioritize traffic during resource congestion, ATM cells are assigned one of the two types of Cell Loss Priority (CLP), CLP=0 and CLP=1. ATM cells with CLP=0 have a higher priority in regard to cell loss than ATM cells with CLP=1. Therefore, during resource congestions, CLP=1 cells are dropped before any CLP=0 cell is dropped.

3.3.3. QoS Class

RFC1695 specified that one of a number of Quality of Service (QoS) classes is assigned to a VCC or VPC by associating the object atmTrafficQoSClass with each VCL or VPL. However, new insights in ATM traffic management have caused this object to be deprecated.

3.3.4. Service Category

Replacing QoS Class, VPLs and VCLs are qualified in terms of their service category (atmServiceCategory). When properly configured, VCLs (or VPLs) concatenated to form a VCC (or VPC) will all have the same service category class as that of the VCC (or VPC).

3.4. Max Active and Max Current VPI and VCI Bits

A manager may wish to configure the maximum number of VPI and VCI bits that can be used to identify VPIs and VCIs on a given ATM interface. This value can be less than or equal to the maximum number of bits supported by the interface hardware, and is referred to in the MIB as the Max Active VPI Bits and Max Active VCI Bits.

However, a manager may not be able to configure the Max Active Bits on both ends of an ATM link. For example, the manager may not be allowed write access to the peer's MIB, or there may be hardware limitations on the peer device. Therefore, the two ATM devices may use ILMI to negotiate "Max Current" VPI and VCI bits, which is the maximum number of bits that both interfaces are willing to support. This is illustrated in Figure 5. The relationship between the different parameters is illustrated in Figure 6. Note that if ILMI negotiation is not supported, then the devices have no choice but to use the configured Max Active bits, and assume that it has been configured to the same value on both ends of the link.

IF a: Max Active VPI Bits = 6 (configured)
Max Current VPI Bits = 6 (negotiated)

IF b: Max Active VPI Bits = 8 (configured)
Max Current VPI Bits = 6 (negotiated)

IF c: Max Active VPI Bits = 8 (configured)
Max Current VPI Bits = 8 (negotiated)

IF d: Max Active VPI Bits = 8 (configured)
Max Current VPI Bits = 8 (negotiated)

(between IF a and IF b, the minimum of the two configured "Max Active VPI Bits" is 6, so both interfaces set their "Max Current VPI Bits" to 6. Since IF c and IF d both are configured with "Max Active VPI Bits" of 8, they set their "Max Current VPI Bits" to 8.)

Figure 5

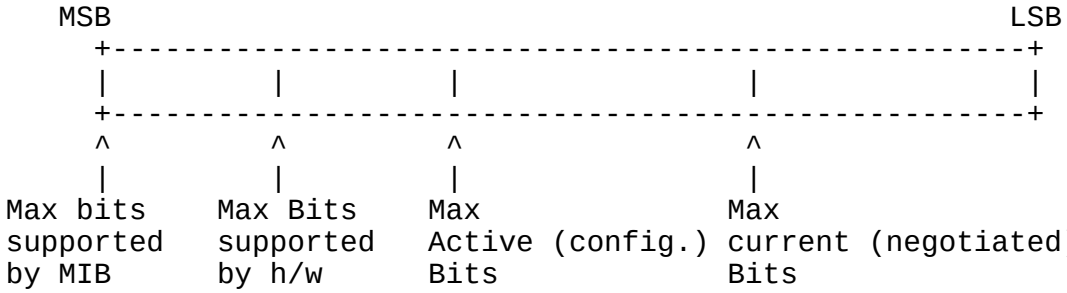

Figure 6

4. Overview

ATM management objects are used to manage ATM interfaces, ATM virtual links, ATM cross-connects, AAL5 entities and AAL5 connections supported by ATM hosts, ATM switches and ATM networks. This section provides an overview and background of how to use this MIB and other potential MIBs for this purpose.

The purpose of this memo is primarily to manage ATM PVCs. ATM SVCs are also represented by the management information in this MIB. However, full management of SVCs may require additional capabilities which are beyond the scope of this memo.

4.1. Background

In addition to the MIB module defined in this memo, other MIB modules are necessary to manage ATM interfaces, links and cross-connects. Examples include MIB II for general system and interface management [16][17], the DS3 or SONET MIBs for management of physical interfaces, and, as appropriate, MIB modules for applications that make use of ATM, such as SMDS. These MIB modules are outside the scope of this specification.

The current specification of this ATM MIB is based on SNMPv2-SMI.

4.2. Structure of the MIB

The managed ATM objects are arranged into the following tables:

(1) ATM interface configuration table
(2) ATM interface DS3 PLCP and TC sublayer tables
(3) ATM traffic parameter table
(4) ATM interface virtual link (VPL/VCL) configuration tables
(5) ATM VP/VC cross-connect tables
(6) AAL5 connection performance statistics table

Note that, managed objects for activation/deactivation of OAM cell flows and ATM traps notifying virtual connection or virtual link failures are outside the scope of this memo.

4.3. ATM Interface Configuration Table

This table contains information on ATM cell layer configuration of local ATM interfaces on an ATM device in addition to the information on such interfaces contained in the ifTable.

4.4. ATM Interface DS3 PLCP and TC Layer Tables

These tables provide performance statistics of the DS3 PLCP and TC sublayer of local ATM interfaces on a managed ATM device. DS3 PLCP and TC sublayer are currently used to carry ATM cells respectively over DS3 and SONET transmission paths.

4.5. ATM Virtual Link and Cross-Connect Tables

ATM virtual link and cross-connect tables model bi-directional ATM virtual links and ATM cross-connects. The ATM VP/VC link tables are implemented in an ATM host, ATM switch and ATM network. The ATM switch and ATM network also implement the ATM VP/VC cross-connect tables. Both link and cross-connect tables are implemented in a carrier’s network for Customer Network Management (CNM) purposes.

The ATM virtual link tables are used to create, delete or modify ATM virtual links in an ATM host, ATM switch and ATM network. ATM virtual link tables along with the cross-connect tables are used to create, delete or modify ATM cross-connects in an ATM switch or ATM network (e.g., for CNM purposes).

For a PVC, the cross-connect between two VPLs is represented in the atmVpCrossConnectTable of the ATM-MIB, indexed by the atmVplCrossConnectIdentifier values for the two VPLs, and the cross-

rconnect between two VCLs is represented in the atmVcCrossConnectTable of the ATM-MIB, indexed by the atmVclCrossConnectIdentifier values for the two VCLs.

For an SVC or Soft PVC the VPL and VCL tables defined in this memo are used. Hoewever, for an SVC or Soft PVC the cross-connect between two VPLs is represented in the atmSvcVpCrossConnectTable of the ATM2-MIB, indexed by the atmVplCrossConnectIdentifier values for the two VPLs, and the cross-connect between two VCLs is represented in the atmSvcVcCrossConnectTable of the ATM2-MIB, indexed by the atmVclCrossConnectIdentifier values for the two VCLs.

Note: The ATM2-MIB module was being defined in a separate memo at the time of this publication. Please consult the RFC directory for an exact reference.

5. Application of MIB II to ATM

5.1. The System Group

For the purposes of the sysServices object in the System Group of MIB II [16], ATM is a data link layer protocol. Thus, for ATM switches and ATM networks, sysServices will have the value "2".

5.2. The Interface Group

The Interfaces Group of MIB II defines generic managed objects for managing interfaces. This memo contains the media-specific extensions to the Interfaces Group for managing ATM interfaces.

This memo assumes the interpretation of the Interfaces Group to be in accordance with [17] which states that the interfaces table (ifTable) contains information on the managed resource’s interfaces and that each sub-layer below the internetwork layer of a network interface is considered an interface. Thus, the ATM cell layer interface is represented as an entry in the ifTable. This entry is concerned with the ATM cell layer as a whole, and not with individual virtual connections which are managed via the ATM-specific managed objects specified in this memo. The inter-relation of entries in the ifTable is defined by Interfaces Stack Group defined in [17].

5.2.1. Support of the ATM Cell Layer by ifTable

Some specific interpretations of ifTable for the ATM cell layer follow.

Object	Use for the generic ATM layer
ifIndex	Each ATM port is represented by an ifEntry.
ifDescr	Description of the ATM interface.
ifType	The value that is allocated for ATM is 37.
ifSpeed	The total bandwidth in bits per second for use by the ATM layer.
ifPhysAddress	The interface's address at the ATM protocol sublayer; the ATM address which would be used as the value of the Called Party Address Information Element (IE) of a signalling message for a connection which either: - would terminate at this interface, or - for which the Called Party Address IE would need to be replaced by the Called Party SubAddress IE before the message was forwarded to any other interface. For an interface on which signalling is not supported, then the interface does not necessarily have an address, but if it does, then ifPhysAddress is the address which would be used as above in the event that signalling were supported. If the interface has multiple such addresses, then ifPhysAddress is its primary address. If the interface has no addresses, then ifPhysAddress is an octet string of zero length. Address encoding is as per [20]. Note that addresses assigned for purposes other than those listed above (e.g., an address associated with the service provider side of a public network UNI) may be represented through atmInterfaceSubscrAddress.
ifAdminStatus	See [17].
ifOperStatus	Assumes the value down(2) if the ATM cell layer is down.
ifLastChange	See [17].
ifInOctets	The number of received octets over the interface, i.e., the number of received, assigned cells multiplied by 53.
ifOutOctets	The number of transmitted octets over the interface, i.e., the number of transmitted, assigned cells multiplied by 53.

ifInErrors The number of cells dropped due to uncorrectable HEC errors.

ifInUnknownProtos The number of received cells discarded during cell header validation, including cells with unrecognized VPI/VCI values, and cells with invalid cell header patterns. If cells with undefined PTI values are discarded, they are also counted here.

ifOutErrors See [17].

ifName Textual name (unique on this system) of the interface or an octet string of zero length.

ifLinkUpDownTrapEnable Default is disabled (2).

ifConnectorPresent Set to false (2).

ifHighSpeed See [17].

ifHCInOctets The 64-bit version of ifInOctets; supported if required by the compliance statements in [17].

ifHCOutOctets The 64-bit version of ifOutOctets; supported if required by the compliance statements in [17].

ifAlias The non-volatile 'alias' name for the interface as specified by a network manager.

6. Support of the AAL3/4 Based Interfaces

For the management of AAL3/4 CPCS layer, see [18].

7. Support of the AAL5 Managed Objects

Support of AAL5 managed objects in an ATM switch and ATM host are described below.

7.1. Managing AAL5 in a Switch

Managing AAL5 in a switch involves:

(1) performance management of an AAL5 entity as an internal resource in a switch

(2) performance management of AAL5 per virtual connection

AAL5 in a switch is modeled as shown in Figure 7 and 8. AAL5 will be managed in a switch for only those virtual connections that carry AAL5 and are terminated at the AAL5 entity in the switch. Note that, the virtual channels within the ATM UNIs carrying AAL5 will be switched by the ATM switching fabric (termed as ATM Entity in the figure) to the virtual channels on a proprietary internal interface associated with the AAL5 process (termed as AAL5 Entity in the figure). Therefore, performance management of the AAL5 resource in the switch will be modeled using the ifTable through an internal (pseudo-ATM) virtual interface and the AAL5 performance management per virtual connection will be supported using an additional AAL5 connection table in the ATM MIB. The association between the AAL5 virtual link at the proprietary virtual, internal interface and the ATM virtual link at the ATM interface will be derived from the virtual channel cross-connect table and the virtual channel link table in the ATM MIB. Note that for the proprietary virtual interface the traffic transmit and receive conventions in the virtual channel link table are as follows:

```
Transmitting traffic:  ATM Entity     --->  AAL5 Entity
Receiving traffic:     ATM Entity     <---  AAL5 Entity
```

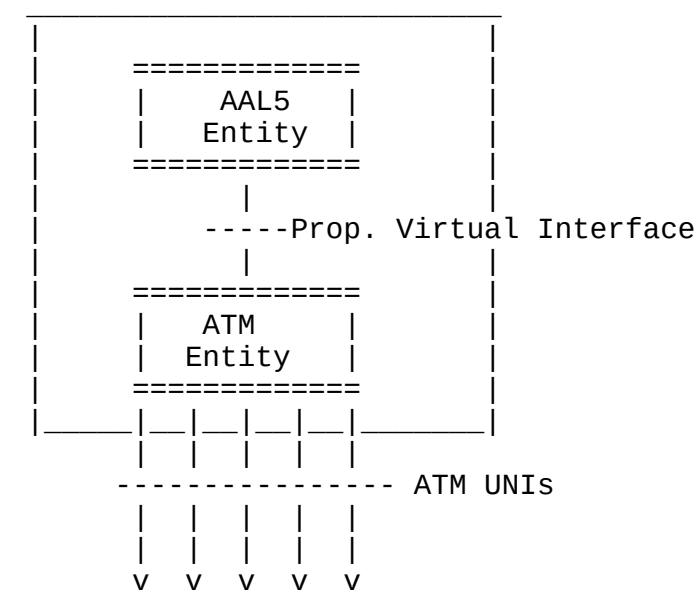

Figure 7: Model of an AAL5 Entity in a Switch

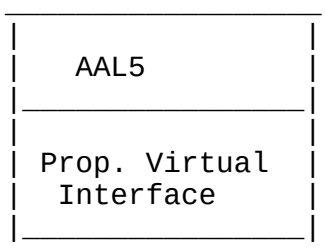

Figure 8: AAL5 Entity's Interface Stack in a Switch

7.2. Managing AAL5 in a Host

Managing AAL5 in a host involves managing the AAL5 sublayer interface as shown in Figure 9 and 10. The AAL5 sublayer is stacked directly over the ATM sublayer. The ifTable is applied to the AAL5 sublayer as defined in Section 10.3.

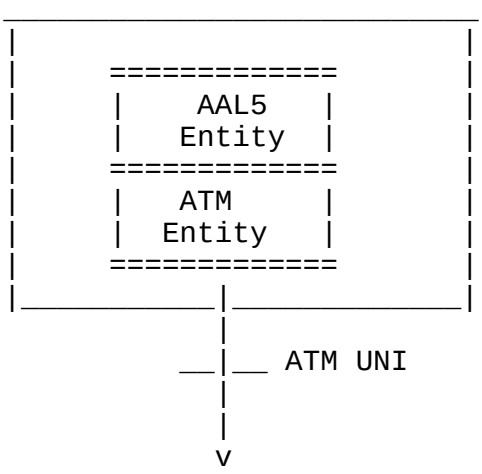

Figure 9: Model of an AAL5 Entity in a Host

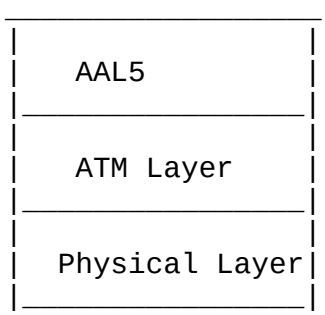

Figure 10: AAL5 Entity's Interface Stack in a Host

7.3. Support of AAL5 by ifTable

The AAL5 entity in an ATM device (e.g., switch or host) is managed using the ifTable. There are additional counters specified for AAL5 than those specified in the ATM B-ICI document [21]. Specific interpretations of ifTable for the AAL5 CPCS layer are as follows.

Object	Use for AAL5 CPCS layer entity
ifIndex	Each AAL5 entity is represented by an ifEntry.
ifDescr	Description of the AAL5 entity.
ifType	The value that is allocated for AAL5 is 49.
ifMtu	Set to the largest PDU size for the AAL5 CPCS layer that can be processed by the AAL5 entity.
ifSpeed	Set to 0.
ifPhysAddress	An octet string of zero length.
ifAdminStatus	See [17].
ifOperStatus	Assumes the value down(2) if the AAL5 layer is down.
ifLastChange	See [17].
ifInOctets	The number of received AAL5 CPCS PDU octets.
ifOutOctets	The number of AAL5 CPCS PDU octets transmitted.
ifInUcastPkts	The number of received AAL5 CPCS PDUs passed to a higher-layer.
ifOutUcastPkts	The number of AAL5 CPCS PDUs received from a higher-layer for transmission. [Note: The number of AAL5 PDUs actually transmitted is the number received from a higher-layer for transmission minus any which are counted by ifOutErrors and ifOutDiscards.]

ifInErrors Number of errored AAL5 CPCS PDUs received. The types of errors counted include CRC-32 errors, SAR time-out errors, and oversized SDU errors.

ifInUnknownProtos Set to 0.

ifInDiscards Number of received AAL5 CPCS PDUs discarded. Possible reason may be input buffer overflow.

ifOutErrors Number of AAL5 CPCS PDUs that could not be transmitted due to errors.

ifOutDiscards Number of AAL5 CPCS PDUs received for transmission that are discarded. Possible reason may be output buffer overflow.

ifInMulticastPkts Set to 0.

ifInBroadcastPkts Set to 0.

ifOutMulticastPkts Set to 0.

ifOutBroadcastPkts Set to 0.

ifName Textual name (unique on this system) of the AAL5 entity or an octet string of zero length.

ifHighSpeed Set to 0.

ifConnectorPresent Set to false (2).

ifPromiscuousMode Set to false(2).

ifLinkUpDownTrapEnable Default is disabled (2).

ifAlias The non-volatile 'alias' name for the interface as specified by a network manager.

7.4. Support of Proprietary Virtual Interface by ifTable

Specific interpretations of ifTable for the proprietary virtual, internal interface associated with an AAL5 entity in an ATM switch are as follows.

Object	Use for proprietary virtual, internal interface associated with AAL entities
ifIndex	Each proprietary virtual, internal interface associated with AAL entities is represented by an ifEntry.
ifDescr	Description of the proprietary virtual, internal interface associated with AAL entities.
ifType	The value that is allocated for proprietary virtual, internal interface is 53.
ifSpeed	See [17]. Set to 0 if the speed is not known.
ifPhysAddress	See [17]. An octet string of zero length if no address is used for this interface.
ifAdminStatus	See [17].
ifOperStatus	See [17].
ifLastChange	See [17].
ifName	Textual name (unique on this system) of the interface or an octet string of zero length.
ifHighSpeed	See [17]. Set to 0 if the speed is not known.
ifConnectorPresent	Set to false (2).
ifLinkUpDownTrapEnable	Default is disabled (2).
ifAlias	The non-volatile 'alias' name for the interface as specified by a network manager.

7.5. AAL5 Connection Performance Statistics Table

An AAL5 connection table is used to provide AAL5 performance information for each AAL5 virtual connection that is terminated at the AAL5 entity contained within an ATM switch or host.

8. ILMI MIBs and the ATM Managed Objects

The ILMI MIBs are specified by the ATM Forum as a set of several MIBs, all currently defined in the ILMI Specification [23]. The ILMI protocols and MIBs allow two connected ATM Interface Management Entities (IMEs) to exchange bi-directional parameters, mainly to facilitate auto-configuration between ATM peer entities. The support of the ATM management functions by the ILMI MIBs and those contained in this memo are compared in Table 1. In this table, "yes" in the "ILMI MIBs" column indicates that the management functions are supported by the ILMI MIBs. The parenthesized numbers in the "This memo" column correspond to the sets of tables enumerated in Section 6.2.

For that subset of management information which the ILMI MIBs and this memo have in common, every effort has been made to retain identical semantics and syntax, even though the MIB objects are identified using different OBJECT IDENTIFIERs.

Table 1 - Structuring of ATM Managed Objects

ATM Mgmt.Inf.	ATM Managed Objects	This memo	ILMI MIBs
Local Interface Information:			
ATM interface: physical layer configuration	(1) port identifier	ATM MIB	
	(2) physical transmission types	(1)*	yes
	(3) operational status	MIB II	*
	(4) administrative status		**
	(5) last change status		
ATM interface: cell layer configuration	(1) active VPI/VCI fields	ATM MIB	
	(2) maximum number of VPCs/VCCs	(1)	yes
	(3) configured VPCs/VCCs		**
	(4) ILMI VPI/VCI values		
	(5) Neighbor system info		
	(6) Max. number of VPI/VCI bits		yes
	(7) ATM Subscribed Address		
ATM interface: cell layer performance	(1) received/transmitted cells	MIB II	yes
	(2) cells with HEC error		
	(3) cell header validation errors		

ATM interface: PLCP & TC layer performance	(1)DS3 PLCP severely errored framing seconds	ATM MIB (2)	no	
	(2)DS3 PLCP unavailable seconds			
	(3)DS3 PLCP alarm state			
	(4)out of cell delineation events			
	(5)TC alarm state			
VP/VC link: configuration	(1)VPI or VPI/VCI value	ATM MIB (3,4)	yes ***	
	(2)VCL or VPL operational status			
	(3)VCL/VPL administrative status			
	(4)VCL/VPL last change status			
	(5)transmit/receive traffic/ service category parameters			
	(6)AAL type			
	(7)transmit/receive AAL5 SDU size			
	(8)AAL5 encapsulation type			
	(9)connection topology type			
	(10)use of call control			
VP/VC Cross-connect: configuration	(1)cross-connect identifier			
	(2)port identifier of one end			
	(3)port identifier of the other end	ATM MIB (5)	no	
	(4)VPI or VPI/VCI value of one end			
	(5)VPI or VPI/VCI value of the other end			
	(6)VC/VP cross-connect operational status			
	(7)VC/VP cross-connect administrative status			
	(8)VC/VP last change status			
VCC AAL5 CPCS layer: performance	(1)PDUs discarded for CRC errors	ATM MIB (6)	no	
	(2)PDUs discarded due to reassembly time out			
	(3)PDUs discarded due to large SDUs			
AAL5 entity:	(1)received/transmitted PDUs			
	(2)PDUs discarded due to protocol errors	MIB II	no	
	(3)a set of configuration/state parameters			

*The operational, administrative, and last change status of the ATM interface and the physical transmission type shall be supported by the interface table in MIB II [16][17]. ILMI does not contain the administrative and last change status of the ATM interface.

** The ILMI MIB contains read-only objects for various parameters at the ATM interface level.

***The ILMI MIBs contain local and end-to-end operational status of the VPC/VCC segment. However, it does not contain the VPC/VCC administrative and last change status and the VCC AAL information.

     DESCRIPTION
      "This is the MIB Module for ATM and AAL5-related
       objects for managing ATM interfaces, ATM virtual
```

```
          links, ATM cross-connects, AAL5 entities, and
          and AAL5 connections."
        REVISION      "9810191200Z"
        DESCRIPTION
         "The initial revision of this module was published
          as RFC 1695. Key revisions include:
          o  Textual Conventions and OBJECT IDENTITIES have
             been moved to a separate MIB module.
          o  Applicability of objects to PVCs, SVCs and Soft
             PVCs has been clarified.
          o  DEFVAL clauses have been added.
          o  The relationship of ifIndex values with different
             layers and sublayers related to ATM has been
             clarified.
          o  atmTrafficQosClass has been deprecated
             and replaced with atmServiceCategory.
          o  atmInterfaceCurrentMaxVpiBits and
             atmInterfaceCurrentMaxVciBits have been added with
             a description on their relationship with other
             objects.
          o  atmInterfaceAddressType and atmInterfaceAdminAddress
             have been deprecated and replaced by
             atmInterfaceSubscrAddress.
          o  atmInterfaceTCAlarmState has been clarified.
          o  atmTrafficDescrParamIndexNext has been introduced
             in order to provide a manager a free
             atmTrafficDescrParamIndex value.
          o  The atmTrafficFrameDiscard capability has been added.
          o  A connection topology type (atmVpl/VclCastType) and
             a call control type (atmVpl/VclConnKind) have been
             added.
          o  aal2 has been added to atmVccAalType."

     -- The management application can then compare a set of
     -- ATM traffic parameters with a single value.

     -- If no suitable row(s) in the atmTrafficDescrParamTable
     -- exists, the manager must create a new row(s) in this
     -- table. If such a row is created, agent checks the
     -- sanity of that set of ATM traffic parameter values.

     -- The manager may use atmTrafficDescrParamIndexNext
     -- in order to obtain a free atmTrafficDescrParamIndex
     -- value.

     -- When creating a new row, the parameter values
     -- will be checked for self-consistency.
     -- Predefined/template rows may be supported.

     -- A row in the atmTrafficDescrParamTable is deleted
     -- by setting the atmTrafficDescrRowStatus to destroy(6).
     -- The agent will check whether this row is still in use
     -- by any entry of the atmVplTable or atmVclTable.
     -- The agent denies the request if the row is still in
     -- use.

           "The Virtual Path Link (VPL) table.  A
            bi-directional VPL is modeled as one entry
            in this table. This table can be used for
            PVCs, SVCs and Soft PVCs.
            Entries are not present in this table for
            the VPIs used by entries in the atmVclTable."
          ::= { atmMIBObjects 6}

     atmVplEntry         OBJECT-TYPE
          SYNTAX         AtmVplEntry
          MAX-ACCESS     not-accessible
          STATUS         current
          DESCRIPTION
           "An entry in the VPL table.  This entry is
            used to model a bi-directional VPL.
            To create a VPL at an ATM interface,
            either of the following procedures are used:

            Negotiated VPL establishment

          (1) The management application creates
              a VPL entry in the atmVplTable
              by setting atmVplRowStatus to createAndWait(5).
              This may fail for the following reasons:
              - The selected VPI value is unavailable,
              - The selected VPI value is in use.
              Otherwise, the agent creates a row and
              reserves the VPI value on that port.

          (2) The manager selects an existing row(s) in the
              atmTrafficDescrParamTable,
              thereby, selecting a set of self-consistent
              ATM traffic parameters and the service category
              for receive and transmit directions of the VPL.

         (2a) If no suitable row(s) in the
              atmTrafficDescrParamTable exists,
              the manager must create a new row(s)
              in that table.

         (2b) The manager characterizes the VPL's traffic
              parameters through setting the
              atmVplReceiveTrafficDescrIndex and the
```

```
            atmVplTransmitTrafficDescrIndex values
            in the VPL table, which point to the rows
            containing desired ATM traffic parameter values
            in the atmTrafficDescrParamTable.  The agent
            will check the availability of resources and
            may refuse the request.
            If the transmit and receive service categories
            are inconsistent, the agent should refuse the
            request.

        (3) The manager activates the VPL by setting the
            the atmVplRowStatus to active(1).
            If this set is successful, the agent has
            reserved the resources to satisfy the requested
            traffic parameter values and the service category
            for that VPL.

        (4) If the VPL terminates a VPC in the ATM host
            or switch, the manager turns on the
            atmVplAdminStatus to up(1) to turn the VPL
            traffic flow on.  Otherwise, the
            atmVpCrossConnectTable  must be used
            to cross-connect the VPL to another VPL(s)
            in an ATM switch or network.

          One-Shot VPL Establishment

          A VPL may also be established in one step by a
          set-request with all necessary VPL parameter
          values and atmVplRowStatus set to createAndGo(4).

          In contrast to the negotiated VPL establishment
          which allows for detailed error checking
          (i.e., set errors are explicitly linked to
          particular resource acquisition failures),
          the one-shot VPL establishment
          performs the setup on one operation but
          does not have the advantage of step-wise
          error checking.

          VPL Retirement

          A VPL is released by setting atmVplRowStatus to
          destroy(6), and the agent may release all
          associated resources."

     --  ATM Interface Virtual Channel Link (VCL) Table

     -- This table contains configuration and state
     -- information of a bi-directional Virtual Channel
     -- Link (VCL) at an ATM interface.
```

```
-- This table can be used to create, delete or modify
-- a VCL that is terminated in an ATM host or switch.
-- This table can also be
-- used to create, delete or modify a VCL that is
-- cross-connected to another VCL.

--  The ATM Interface VCL Table

atmVclTable         OBJECT-TYPE
     SYNTAX         SEQUENCE OF AtmVclEntry
     MAX-ACCESS     not-accessible
     STATUS         current
     DESCRIPTION
      "The Virtual Channel Link (VCL) table.  A
       bi-directional VCL is modeled as one entry
       in this table. This table can be used for
       PVCs, SVCs and Soft PVCs."
     ::= { atmMIBObjects 7}

atmVclEntry         OBJECT-TYPE
     SYNTAX         AtmVclEntry
     MAX-ACCESS     not-accessible
     STATUS         current
     DESCRIPTION
      "An entry in the VCL table. This entry is
       used to model a bi-directional VCL.
       To create a VCL at an ATM interface,
       either of the following procedures are used:

       Negotiated VCL establishment

     (1) The management application creates
         a VCL entry in the atmVclTable
         by setting atmVclRowStatus to createAndWait(5).
         This may fail for the following reasons:
         - The selected VPI/VCI values are unavailable,
         - The selected VPI/VCI values are in use.
         Otherwise, the agent creates a row and
         reserves the VPI/VCI values on that port.

     (2) The manager selects an existing row(s) in the
         atmTrafficDescrParamTable,
         thereby, selecting a set of self-consistent
         ATM traffic parameters and the service category
         for receive and transmit directions of the VCL.
```

(2a) If no suitable row(s) in the atmTrafficDescrParamTable exists, the manager must create a new row(s) in that table.

(2b) The manager characterizes the VCL's traffic parameters through setting the atmVclReceiveTrafficDescrIndex and the atmVclTransmitTrafficDescrIndex values in the VCL table, which point to the rows containing desired ATM traffic parameter values in the atmTrafficDescrParamTable. The agent will check the availability of resources and may refuse the request.
If the transmit and receive service categories are inconsistent, the agent should refuse the request.

(3) The manager activates the VCL by setting the the atmVclRowStatus to active(1) (for requirements on this activation see the description of atmVclRowStatus).
If this set is successful, the agent has reserved the resources to satisfy the requested traffic parameter values and the service category for that VCL.

(4) If the VCL terminates a VCC in the ATM host or switch, the manager turns on the atmVclAdminStatus to up(1) to turn the VCL traffic flow on. Otherwise, the atmVcCrossConnectTable must be used to cross-connect the VCL to another VCL(s) in an ATM switch or network.

One-Shot VCL Establishment

A VCL may also be established in one step by a set-request with all necessary VCL parameter values and atmVclRowStatus set to createAndGo(4).

In contrast to the negotiated VCL establishment which allows for detailed error checking (i.e., set errors are explicitly linked to particular resource acquisition failures), the one-shot VCL establishment performs the setup on one operation but does not have the advantage of step-wise error checking.

```
          VCL Retirement

          A VCL is released by setting atmVclRowStatus to
          destroy(6), and the agent may release all
          associated resources."

--     ATM Virtual Path (VP) Cross Connect Table

-- This table contains configuration and state
-- information of point-to-point,
-- point-to-multipoint, or multipoint-to-multipoint
-- VP cross-connects for PVCs.

-- This table has read-create access and can be used
-- to cross-connect the VPLs together in an ATM switch
-- or network. The atmVpCrossConnectIndex
-- is used to associate the related
-- VPLs that are cross-connected together.

-- The ATM VP Cross Connect Table
-- models each bi-directional VPC
-- cross-connect as a set of entries in
-- the atmVpCrossConnectTable. A
-- point-to-point VPC cross-connect is modeled
-- as one entry; a point-to-multipoint (N leafs) VPC
-- cross-connect as N entries in this table; and
-- a multipoint-to-multipoint (N parties) VPC cross-
-- connect as N(N-1)/2 entries in this table.
-- In the latter cases, all the N (or N(N-1)/2) entries
-- are associated with a single VPC cross-connect by
-- having the same value of atmVpCrossConnectIndex.

--      _____________________________________________
--     |                                             |
--  Low |         ATM Switch or Network               | High
--  port|                                             | port
-- _____|>> from low to high VPC traffic flow >>|_____
--      |<< from high to low VPC traffic flow <<|
--      |                                             |
--      |_____________________________________________|
--

-- The terms low and high are chosen to represent
-- numerical ordering of the two interfaces associated
-- with a VPC cross-connect. That is, the ATM interface
-- with the lower value of ifIndex is termed 'low',
-- while the other ATM interface associated with the
-- VPC cross-connect is termed 'high'. This terminology
```

```
     -- is used to provide directional information; for
     -- example, the atmVpCrossConnectL2HOperStatus applies
     -- to the low->high direction, and
     -- atmVpCrossConnectH2LOperStatus applies to the
     -- high->low  direction, as illustrated above.

     atmVpCrossConnectIndexNext  OBJECT-TYPE
          SYNTAX         INTEGER (0..2147483647)
          MAX-ACCESS     read-only
          STATUS         current
          DESCRIPTION
           "This object contains an appropriate value to
            be used for atmVpCrossConnectIndex when creating
            entries in the atmVpCrossConnectTable.  The value
            0 indicates that no unassigned entries are
            available. To obtain the atmVpCrossConnectIndex
            value for a new entry, the manager issues a
            management protocol retrieval operation to obtain
            the current value of this object.  After each
            retrieval, the agent should modify the value to
            the next unassigned index.
            After a manager retrieves a value the agent will
            determine through its local policy when this index
            value will be made available for reuse."

            An entry in this table models two
            cross-connected VPLs.
            Each VPL must have its atmConnKind set
            to pvc(1)."
          ::= { atmMIBObjects 9 }

     atmVpCrossConnectEntry OBJECT-TYPE
          SYNTAX         AtmVpCrossConnectEntry
```

```
        MAX-ACCESS     not-accessible
        STATUS         current
        DESCRIPTION
         "An entry in the ATM VP Cross Connect table.
          This entry is used to model a bi-directional
          ATM VP cross-connect which cross-connects
          two VPLs.

          Step-wise Procedures to set up a VP Cross-connect

          Once the entries in the atmVplTable are created,
          the following procedures are used
          to cross-connect the VPLs together.

         (1) The manager obtains a unique
             atmVpCrossConnectIndex by reading the
             atmVpCrossConnectIndexNext object.

         (2) Next, the manager creates a set of one
             or more rows in the ATM VP Cross Connect
             Table, one for each cross-connection between
             two VPLs.  Each row is indexed by the ATM
             interface port numbers and VPI values of the
             two ends of that cross-connection.
             This set of rows specifies the topology of the
             VPC cross-connect and is identified by a single
             value of atmVpCrossConnectIndex.

          Negotiated VP Cross-Connect Establishment

        (2a) The manager creates a row in this table by
             setting atmVpCrossConnectRowStatus to
             createAndWait(5).  The agent checks the
             requested topology and the mutual sanity of
             the ATM traffic parameters and
             service categories, i.e., the row creation
             fails if:
             - the requested topology is incompatible with
               associated values of atmVplCastType,
             - the requested topology is not supported
               by the agent,
             - the traffic/service category parameter values
               associated with the requested row are
               incompatible with those of already existing
               rows for this VP cross-connect.
             [For example, for setting up
             a point-to-point VP cross-connect, the
             ATM traffic parameters in the receive direction
```

of a VPL at the low end of the cross-connect must equal to the traffic parameters in the transmit direction of the other VPL at the high end of the cross-connect, otherwise, the row creation fails.] The agent also checks for internal errors in building the cross-connect.

The atmVpCrossConnectIndex values in the corresponding atmVplTable rows are filled in by the agent at this point.

(2b) The manager promotes the row in the atmVpCrossConnectTable by setting atmVpCrossConnectRowStatus to active(1). If this set is successful, the agent has reserved the resources specified by the ATM traffic parameter and Service category values for each direction of the VP cross-connect in an ATM switch or network.

(3) The manager sets the atmVpCrossConnectAdminStatus to up(1) in all rows of this VP cross-connect to turn the traffic flow on.

One-Shot VP Cross-Connect Establishment

A VP cross-connect may also be established in one step by a set-request with all necessary parameter values and atmVpCrossConnectRowStatus set to createAndGo(4).

In contrast to the negotiated VP cross-connect establishment which allows for detailed error checking (i.e., set errors are explicitly linked to particular resource acquisition failures), the one-shot VP cross-connect establishment performs the setup on one operation but does not have the advantage of step-wise error checking.

VP Cross-Connect Retirement

A VP cross-connect identified by a particular value of atmVpCrossConnectIndex is released by:

(1) Setting atmVpCrossConnectRowStatus of all

```
            rows identified by this value of
            atmVpCrossConnectIndex to destroy(6).
            The agent may release all
            associated resources, and the
            atmVpCrossConnectIndex values in the
            corresponding atmVplTable row are removed.
            Note that a situation when only a subset of
            the associated rows are deleted corresponds
            to a VP topology change.

         (2) After deletion of the appropriate
            atmVpCrossConnectEntries, the manager may
            set atmVplRowStatus to destroy(6) the
            associated VPLs.  The agent releases
            the resources and removes the associated
            rows in the atmVplTable.

          VP Cross-connect Reconfiguration

          At the discretion of the agent, a VP
          cross-connect may be reconfigured by
          adding and/or deleting leafs to/from
          the VP topology as per the VP cross-connect
          establishment/retirement procedures.
          Reconfiguration of traffic/service category parameter
          values requires release of the VP cross-connect
          before those parameter values may by changed
          for individual VPLs."

     -- This table contains configuration and state
     -- information of point-to-point,
     -- point-to-multipoint or multipoint-to-multipoint
     -- VC cross-connects for PVCs.

     -- This table has read-create access and is used
     -- to cross-connect the VCLs together in an ATM switch
     -- or network that belong to a VC connection.
     -- The atmVcCrossConnectIndex is used to associate
     -- the related VCLs that are cross-connected together.

     -- The model using step-wise procedures described for setting
     -- up a VP cross-connect is also used for setting up
     -- a VC cross-connect.
```

```
     atmVcCrossConnectIndexNext  OBJECT-TYPE
          SYNTAX         INTEGER (0..2147483647)
          MAX-ACCESS     read-only
          STATUS         current
          DESCRIPTION
           "This object contains an appropriate value to
            be used for atmVcCrossConnectIndex when creating
            entries in the atmVcCrossConnectTable.  The value
            0 indicates that no unassigned entries are
            available. To obtain the atmVcCrossConnectIndex
            value for a new entry, the manager issues a
            management protocol retrieval operation to obtain
            the current value of this object.  After each
            retrieval, the agent should modify the value to
            the next unassigned index.
            After a manager retrieves a value the agent will
            determine through its local policy when this index
            value will be made available for reuse."

            An entry in this table models two
            cross-connected VCLs.
            Each VCL must have its atmConnKind set
            to pvc(1)."
          ::= { atmMIBObjects 11 }

     atmVcCrossConnectEntry OBJECT-TYPE
          SYNTAX       AtmVcCrossConnectEntry
          MAX-ACCESS   not-accessible
          STATUS       current
          DESCRIPTION
           "An entry in the ATM VC Cross Connect table.
            This entry is used to model a bi-directional ATM
            VC cross-connect cross-connecting two end points.

            Step-wise Procedures to set up a VC Cross-connect
```

Once the entries in the atmVclTable are created, the following procedures are used to cross-connect the VCLs together to form a VCC segment.

(1) The manager obtains a unique atmVcCrossConnectIndex by reading the atmVcCrossConnectIndexNext object.

(2) Next, the manager creates a set of one or more rows in the ATM VC Cross Connect Table, one for each cross-connection between two VCLs. Each row is indexed by the ATM interface port numbers and VPI/VCI values of the two ends of that cross-connection. This set of rows specifies the topology of the VCC cross-connect and is identified by a single value of atmVcCrossConnectIndex.

Negotiated VC Cross-Connect Establishment

(2a) The manager creates a row in this table by setting atmVcCrossConnectRowStatus to createAndWait(5). The agent checks the requested topology and the mutual sanity of the ATM traffic parameters and service categories, i.e., the row creation fails if:
- the requested topology is incompatible with associated values of atmVclCastType,
- the requested topology is not supported by the agent,
- the traffic/service category parameter values associated with the requested row are incompatible with those of already existing rows for this VC cross-connect.

[For example, for setting up a point-to-point VC cross-connect, the ATM traffic parameters in the receive direction of a VCL at the low end of the cross-connect must equal to the traffic parameters in the transmit direction of the other VCL at the high end of the cross-connect, otherwise, the row creation fails.] The agent also checks for internal errors in building the cross-connect.

The atmVcCrossConnectIndex values in the

corresponding atmVclTable rows are filled in by the agent at this point.

(2b) The manager promotes the row in the atmVcCrossConnectTable by setting atmVcCrossConnectRowStatus to active(1). If this set is successful, the agent has reserved the resources specified by the ATM traffic parameter and Service category values for each direction of the VC cross-connect in an ATM switch or network.

(3) The manager sets the atmVcCrossConnectAdminStatus to up(1) in all rows of this VC cross-connect to turn the traffic flow on.

One-Shot VC Cross-Connect Establishment

A VC cross-connect may also be established in one step by a set-request with all necessary parameter values and atmVcCrossConnectRowStatus set to createAndGo(4).

In contrast to the negotiated VC cross-connect establishment which allows for detailed error checking i.e., set errors are explicitly linked to particular resource acquisition failures), the one-shot VC cross-connect establishment performs the setup on one operation but does not have the advantage of step-wise error checking.

VC Cross-Connect Retirement

A VC cross-connect identified by a particular value of atmVcCrossConnectIndex is released by:

(1) Setting atmVcCrossConnectRowStatus of all rows identified by this value of atmVcCrossConnectIndex to destroy(6). The agent may release all associated resources, and the atmVcCrossConnectIndex values in the corresponding atmVclTable row are removed. Note that a situation when only a subset of the associated rows are deleted corresponds

```
            to a VC topology change.

           (2) After deletion of the appropriate
               atmVcCrossConnectEntries, the manager may
               set atmVclRowStatus to destroy(6) the
               associated VCLs.  The agent releases
               the resources and removes the associated
               rows in the atmVclTable.

            VC Cross-Connect Reconfiguration

            At the discretion of the agent, a VC
            cross-connect may be reconfigured by
            adding and/or deleting leafs to/from
            the VC topology as per the VC cross-connect
            establishment/retirement procedures.
            Reconfiguration of traffic/service category parameter
            values requires release of the VC cross-connect
            before those parameter values may by changed
            for individual VCLs."

     --

     atmTrafficDescrParamIndexNext  OBJECT-TYPE
          SYNTAX         INTEGER (0..2147483647)
          MAX-ACCESS     read-only
          STATUS         current
          DESCRIPTION
           "This object contains an appropriate value to
            be used for atmTrafficDescrParamIndex when
            creating entries in the
            atmTrafficDescrParamTable.
            The value 0 indicates that no unassigned
            entries are available. To obtain the
            atmTrafficDescrParamIndex value for a new
            entry, the manager issues a management
            protocol retrieval operation to obtain the
            current value of this object.  After each
            retrieval, the agent should modify the value
            to the next unassigned index.
            After a manager retrieves a value the agent will
            determine through its local policy when this index
            value will be made available for reuse."

12. Security Considerations

There are a number of management objects defined in this MIB that have a MAX-ACCESS clause of read-write and/or read-create. Such objects may be considered sensitive or vulnerable in some network environments. The support for SET operations in a non-secure environment without proper protection can have a negative effect on network operations.

The managed objects in this MIB contain sensitive information since, collectively, they allow tracing and influencing of virtual connections in ATM switches or networks and provide information of their traffic characteristics.

It is thus important to control even GET access to these objects and possibly to even encrypt the values of these object when sending them over the network via SNMP. Not all versions of SNMP provide features for such a secure environment.

SNMPv1 by itself is not a secure environment. Even if the network itself is secure (for example by using IPSec), even then, there is no control as to who on the secure network is allowed to access and GET/SET (read/change/create/delete) the objects in this MIB.

It is recommended that the implementers consider the security features as provided by the SNMPv3 framework. Specifically, the use of the User-based Security Model RFC 2274 [12] and the View-based Access Control Model RFC 2275 [15] is recommended.

It is then a customer/user responsibility to ensure that the SNMP entity giving access to an instance of this MIB, is properly configured to give access to the objects only to those principals (users) that have legitimate rights to indeed GET or SET (change/create/delete) them.
